First, let me go on the record as violently opposing any coordinator or coordination council being permitted to collect anything for any work. We must remember that in speaking of coordination, we also have the word "voluntary." To me, that has always meant that *everyone* involved in the coordination process is performing on a voluntary basis. Unfortunately—at least in Alabama—there appear to be some who feel that the position of coordinator or coordination-council member should be a paid position, and that the person putting up a repeater should pay the costs. Well, what happens to the meaning of "voluntary" then? Half of it disappears. Also, without a maximum allowable fee, such coordination charges would be open to abuses by individuals or groups who might see in the situation an easy way to profit from such an undertaking.

To show you just how outlandish this could get, let's look at the all-volunteer testing program for a moment. You will notice that one publication, the *W5YI Report*, written by my friend Fred Maia, is accredited as a VEC in all testing districts. While the FCC hates the term, Fred is a de facto national VEC. With this as a precedent, why shouldn't *73* become a "Frequency Coordinator Accredited in all States and Coordination Districts"? Absurd? You bet, but I'll also bet that there will be some individual or group who will do just that if coordination fees are permitted.

Let's continue this stupid hypothesis for a few more paragraphs. Obviously, we must figure out a fee schedule that is based on "average" cost nationally. Well, turning to the various land-mobile service coordination groups, we note that the average is only a few thousand dollars per system. Since the cost to find a home for a ham repeater is not really any different in the amount of labor and time than finding a home for a land-mobile system, it's obvious that the same charges would be equitable. Right? So, since we obviously must charge based on a "national average" of costs involved, we find that $2,000 for initial coordination and $200 per year for maintenance of the data base is about right.

But wait! What about the coordinator or council already serving your area? The guys and gals who have been doing a good job, free of charge, for many, many years? Well, there is nothing to keep them from coordinating repeaters as well. In fact, if we again use the all-volunteer testing program as our guide, you note that there are the de facto national VECs such as the *W5YI Report*, the ARRL, Metroplex, and DeVry. There are also many regional VECs that serve only one specific call area, such as the Sunnyvale VEC, the Greater Los Angeles Amateur Group VEC, and the SANDRA

VEC. All serve only the 6th call district, which also happens to be the 6th testing district. So, the 6th district is served quite well by seven VECs!

Coordinationwise, California has four officially recognized repeater councils plus a few "splinter groups" as well. In the northern half of the state, the Northern Amateur Relay Council has been the main entity for a decade and a half. (Its authority to coordinate has recently been challenged by a group calling itself the Greater Pacific Coordination Council, which wants everything north of San Francisco and the area covered by the Central Valley Repeater Association. As the group's name implies, it wants jurisdiction over everything in the way of amateur relay stations operating off hilltops in California's Central Valley area.)

Then when you cross the Tehachapi Mountains, you get into Southern California, where 10 meters, 6 meters, 3/4 meters, and all bands above are the domain of the Southern California Repeater and Remote Base Association. Those are the fine fellows who absolutely refuse to publish a list of all activity on the UHF bands they coordinate because they consider everything and its uncle to be "private turf." Oh, they do list a smattering of supposedly "public-access" repeaters. (Does this mean that no license is required?) But what about the other 500–600 systems that pervade the Southern California UHF airwaves? Supposedly, they "do not exist" as far as the outside world is concerned.

Two meters and 1-1/4 meters each has its own coordination council, which operates on a by-band basis. Two meters is represented by the Two Meter Area Spectrum Management Association, while 1-1/4 meters is the domain of the 220 SMA. Unlike their UHF counterpart, neither of these groups is paranoid about letting the world know that these bands are utilized—in fact, very, very utilized. So much so, that it's virtually impossible to get a two-meter repeater channel pair anywhere in California—that is, from the current coordinators. (The South also has several splinter coordination groups, but like those in the North they have no meaningful public recognition. Three exist, all based on the demographic characteristics of their constituencies.)

Obviously, a good entrepreneur could really clean up in California! I can just picture the advertisements in all of the ham magazines:

California Hams!

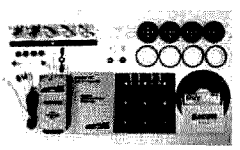
Tired of waiting for a frequency for your new two-meter repeater? Tired of the NARC and TASMA runaround? The *73* Amateur Radio National Frequency Coordinator can get your repeater on the air. Send check or money order for $2,000 today. Frequencies now also available on every band for repeaters, remotes, digipeaters, and simpatches. We coordinate everything, everywhere if you will pay the fee!

Don't worry; you are not going to see this ad anywhere except in this hypothetical treatise. *73* is not about to get into repeater coordination! If it did, it would probably fall on my shoulders, and I have enough worries right now without taking on national frequency "speculation."

While we are on a roll, let's keep on going. Why just coordinate repeaters, remotes, and other relay systems? While we are at it, how about the low bands? Think of the bucks that could be made by forcing your coordination onto all of those 75-meter rag-chews and nets. How about selling discrete operating frequencies to DXpeditions, or better yet, to those multi-multis trying to make the contact from stateside? It's well-known that the DX crowd is the wealthiest part of ham radiodom. How much is a clear spot on the low end of 20 meters worth? Would someone pay $20,000, or maybe even $50,000 or more? And all those wealthy yachtsmen on 14.313 MHz busy conning naive stateside hams into breaking Part 97 rules by making business calls and business autopatches for them. . . well, if they can afford a $2,000,000 yacht and a $2,000 top-of-the-line radio, how about a "coordination fee" to them of say. . . $1,000 a year. If any hams can afford such a coordination fee, they can!

And we must not forget our ham satellites. If fees are "in order and legal," then why not permit AMSAT to "coordinate" everyone who uses one of the OSCAR birds? Currently, the cost of commercial time on a communications satellite such as Galaxy or Telstar is about $750 an hour, not counting the uplink and downlink facilities. Since we hams have our own uplinks and downlinks, we need to consider only satellite transponder time. Now, what true-blue, died-in-the-wool satellite fancier would not be willing to pay that pittance to AMSAT for the privilege of having his or her signal heard throughout the footprint of an OSCAR bird? And what a boon to AMSAT if they had several hundred thousand dollars a month coming into their coffers. New satellites would be going up on a regular basis. They could even have companies like RCA or Hughes build them!

The possibilities opened by the FCC permitting the collection of coordination fees are endless! You need only search your imagination to quickly become the richest ham in town.



So, while fees may seem innocent enough on the surface, they are far from that. In fact, I feel that permitting coordinators and councils to collect fees of any sort is to invite the kinds of problems that we hams are ill-prepared to cope with. I have nothing against repeater councils charging membership dues to those who wish to join such a group, as long as membership is on a voluntary basis. In fact, that has been a tradition down through the ages with any club or organization. There is a difference between charging an annual fee to those who wish voluntarily to join an organization and forcing someone to pay a specific fee for a service rendered. Coordinators and councils do not now sell frequencies, but given the legal right to collect fees for performing the coordination process, they soon would.

In Alabama, a $10 fee for initial coordination and $5 for any changes was proposed. Whether this fee will ever be initiated in the state is unknown. Also unknown is whether the FCC will act to close this loophole in its regulations to prevent the imposition of such fees by coordinators or coordination councils. As stated earlier, I oppose the collection of fees by frequency coordinators. In two decades of operation, the concept of voluntary coordination has worked because those involved were individually and collectively dedicated to preserving a sense of sanity on our VHF and UHF bands. Institution of fees will only commercialize amateur radio further and make buying a repeater channel pair as easy as buying a prefabricated repeater system itself. Is that what ham radio is all about?■

"When You Buy, Say 73"

TURN YOUR COMPUTER INTO A

ROBOTIC WORKSHOP

The **ROBOTIC WORKSHOPS** plug into your home computer and include everything you'll need to build hundreds of projects. The **WORKSHOPS** contain interface unit, motors, gears, sensors, construction components, software and instructions.

FOR THE BEGINNER:
You'll start by building sample projects that we've designed for you. A knowledge of programming is **not** required to perform these projects. We've included full instructions and operating software.

FOR THE BASIC PROGRAMMER:
When you're ready to design and build your own projects, we show you how. We've added 25 new commands to the "BASIC" programming language.

FOR THE ADVANCED PROGRAMMER AND HOBBIEST:
For the serious user we have included technical specs, schematics, machine language routines and advanced commands and techniques.

PREDESIGNED EXAMPLE PROJECTS INCLUDE:

- **MOTORS,** Gears and Generators
- Velocity and Motion
- Motorized Mechanical **ROBOTICS**
- **INFRARED SENSORS**
- Digital Storage **OSCILLOSCOPE**
- Digital **VOLTMETER**
- **SPEECH** Digitization and Playback
- Electronic Counting and Timing
- Computer Controlled Models
- Cars, Cranes, **ROBOTICS**

73 INTERNATIONAL

Just because I started this column as a result of visiting DX hams is no reason you shouldn't put in your 2¢ worth and let me know what DX news you find most interesting. My inclination is to have DX ops tell us what they think is interesting—how we can get permission to operate if we're fortunate enough to visit—any coming DXpeditions—what's doing with repeaters—things like that. What do YOU find most interesting? Since we have a world hobby, I think you'll be as interested as I in what is going on. If nothing else, it gives us something to talk about on the air which, from what I'm hearing these days, can't hurt.

—Wayne.

BAHRAIN

Ian Cable A92BW
Amateur Radio Association Bahrain
PO Box 22381
Muharraq
Bahrain
Arabian Gulf

Welcome back to 73 International, Bahrain and A92BW, last seen in this column in June, 1983! We may expect to hear more from ARAB (Amateur Radio Association Bahrain) when something more happens, whenever that might be. As the following shows, it cannot be predicted with any accuracy.

Not much is happening in Bahrain. Some DX gets worked but there are no thoughts of DX operations. The 2m repeater functions on R6 European band plan and enjoys a small and somewhat infrequent following.

Visiting hams are welcome to contact ARAB for information, and we are also listed in the local telephone directory, yellow pages. There is absolutely *no chance* of visitors obtaining a license or even of operating from an already established station here.

We have had a QSL bureau here for the past 30 years—operating out of my personal mailbox for 25 of them. Third-party traffic is not permitted, and there are no special-activity prefixes likely to be aired for the balance of 1986. There is some activity via OSCAR 10 mode B and also HF band AMTOR.

The number of amateurs in Bahrain is smaller than it used to be as the expatriate population has fallen—there is a recession out here, too—but there is a growing awareness of the amateur radio hobby amongst the Bahrainis themselves, which is most welcome.

MIDDLE OF THE WORLD

The first annual "Concurso International DX-HC Mitad del Mundo DX-HC" (International DX-HC Middle of the World Contest) has been announced by its sponsor, the GRC (Guayaquil Radio Club), for the purpose of strengthening "the friendship between the HC and the rest of the world's ham radio operators."

"El Ecuador abraza al mundo y el mundo al Ecuador," the announcement reads—Ecuador embraces the world, and the world embraces Ecuador. The contest will run for 48 continuous hours from 0000 UTC October 4 until 2359 UTC October 5—the first weekend in October will continue to be the days scheduled for this contest.

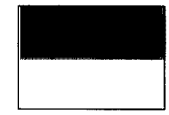
All amateurs are eligible to enter except the special HD stations and members of the GRC contest commission. Frequency: SSB, with the maximum power authorized for the ham's own station license. Call: "CQ HC Contest." Exchange: RS plus three digits (e.g., 59-001 to 59-999). Entry classes: single operator, 7-MHz band; single op, 14-MHz band; single op, both bands; and multi-op, both bands. Contacts on crossband are not permitted, and transmitting two or more signals at the same time, including cases of different bands, is not allowed.

Special Middle-of-the-World callsign stations: HD1GRC on the equator; HDØGRC, the Cayambe Volcano; HD7GRC in the Ecuadorian Amazon; and HD8GRC on Galapagos Island. Contact with these is worth 20 points for both HC and non-HC stations. Non-HC station contacts with HC stations are worth 10 points as are HC contacts with non-HC stations. Non-HC multipliers: the sum of the numerals of worked HC zones (only once and per band), so that the maximum multiplier for 7 MHz is 36, as is the maximum also for 14 MHz, since 1+2+3+4+5+6+7+8=36.

HC zones are:

HC1—Carchi, Imbabura, Pichincha
HC2—Guayas, Los Rios
HC3—El Oro, Loja
HC4—Manabi, Esmeraidas
HC5—Chimborazo, Canar, Azuay
HC6—Cotopaxi, Tungurahua, Bolivar
HC7—Ecuadorian Amazon
HC8—Galapagos Island

HC contacts with HC stations are worth 5 points; HC multiplier is the number of countries worked, according to the ARRL list. Only one contact per station per band can be counted. Total score is the sum of the contact points on each band times the multiplier for that band.



Summary sheet: Write in your declaration and signature to give evidence of following the contest rules; include callsign, full name, entry class, type of license, and address. Log sheets (separate logs for each band): band worked, date, UTC time of contact, call of station worked, signal report given and received, and summary of points and multiplier.

Summary and logs should be postmarked by December 31, 1986, and mailed with five IRCs to International DX-HC Middle of the World Contest, c/o Contest Manager, Guayaquil Radio Club, PO Box 5757, Guayaquil, Ecuador, South America.

A trophy and diploma will be awarded to non-HC first- and second-place winners in each entry category (a medal and diploma for each HC first- and second-place winner). Only one prize per station. Awards will be made to non-HC stations with more than 30 QSOs with HC stations and 3 or more with HD stations, and to HC stations with more than 60 QSOs, of which at least 30 must be with non-HC stations—and additionally for 7 MHz, there must have been contact with 3 HD stations, and for 14 MHz, with 1 HD station. There will be special WHC (worked all HC) certificates for every station participating in the contest that contacted at least 5 HC zones.

Disqualification: For violation of contest rules; for violation of country-of-origin rules for radio amateurs; for false statement in a report; and for duplicated claim credit on any one band in excess of 5% of the total.

NOTE: First prizes in non-HC categories will be melted granite medallions—reproductions of the "Jama Quaque culture" from Ecuador's Manabi province around 1500-2000 B.C., sculpted by Paul Palacios.

INDONESIA

Erlangga Suryadarma YBØBZZ/V85BZ
ORARI National QSL Bureau
PO Box 96
Jakarta 10002
Indonesia

(Continuation of last month's report by YBØBZZ and Ben S. Samsu YBØEBS.)

As announced at the IARU Region III conference in New Zealand last November, ORARI (Organisasi Amatir Radio Indonesia) now has these plans:

1) To establish better organization throughout the country for the ORARI QSL and Awards Bureaus.

2) To establish a better and continuous publication of periodicals, magazines, and other printed material for members.

3) To establish training sessions for the promotion of international communications.

4) To issue a new ORARI awards program to encourage all members to participate in award-hunting nationally and/or internationally.

"Without question, amateur radio has a bright future for development and growth in Indonesia. With a government sympathetic to it—and especially the provincial governments which are very enthusiastic [because of amateur radio's services in times when communications are otherwise lacking]—amateur radio in In-

donesia should be able to grow strong and heathy to become one of the giant radio societies in Asia and Oceania."

GENERAL INFORMATION

Amateur radio classes and privileges:

- YD—Novice—One-year license, local communications only, 10-Watt output, 80-meter band only.
- YC—General—Three-year license, national communications 75-Watt output, all bands except 20 meters.
- YB—Advance—Three-year license, international communications, 500-Watt output, all bands.

Obtaining a license: Foreigners should have a temporary residence or residence permit for Indonesia and be a national of a country having a reciprocal agreement. [As of a year ago: USA, UK, Canada, Australia, W. Germany, Netherlands, Sweden, Belgium, France, Argentina, and Finland.] Application may then be made with a "request to establish a station" using Form "D" and submitting it with copies of your residence permit, your valid amateur's license issued by your country, and your valid passport, and paying the annual fee of U.S. $7.50. Application should be made to the Directorate General of Post and Telecommunications through the *Daerah* (local, Provincial) level.

License class and privileges will be based on class of license possessed and will be issued for one year (renewable). A callsign prefix will be issued, in the range from AQA to AZZ. NOTE: Operation of an existing station by a transmitting guest *is strictly prohibited.*

New callsigns: When the YD to YB prefixes are fully allocated, a new combination as-yet not announced will be added. The following are in the conceptual stage: YE with one alphabet suffix will be issued for domestic special callsigns for field days, contests, experimental stations, national sports events, etc. A two-digit combination will be used for the two national events: ORARI anniversaries and the Republic of Indonesia Anniversary of the Independence. Secondary prefixes of 7A–7I and 8A–8I will be used only for international events such as World Communications Year, Amateur Radio Day (April 18), United Nations Day, etc.

General operation: Club stations on the *Lokal* (District) level are encouraged to promote activity for communications training—local nets, DXing, seminars, etc. Club callsigns are YB and YC prefixed, plus call area digit, with ZAA–ZZZ suffixes.

Repeater networks on experimental bases have been approved by the government and permits issued at the provincial or district level for supervision by the Province.

"By law, all members should participate in monitoring the amateur band and report any interference, discrepancies, or any activity not in accordance with the general rules of amateur radio." Implementation of this law produced good effects for a period of time, but a certain amount of "spectrum anarchy" resulted from the simultaneous (a) influx of VHF/UHF equipment, (b) governmental approval of Citizens Band use, and (c) the prevailing difficulties or nonexistence of public communications facilities. Involved were illegal importations of equipment, modifications of equipment for allband and wideband use which threatened creation of "a destructive situation for [amateurs] in a developing country since it will be utilized [legally] by commercial and public service parties which can occupy both parts of the amateurs' bands and [the other bands]." This presents "a great task for ORARI"—in education, supervision, and also "to implement strict disciplinary action for members" involved in illegal activities.

ORARI [it was reported at the IARU conference] has been making a special effort to "patrol" the bands, and apologizes for any disturbances which "were exported from Indonesia." IARU-member countries, Region III, were invited to file complaints of any such disturbances, "so that ORARI may forward [them] to the government for further investigations."

To be continued next month.

THE SEARCH FOR AN APEX BODY

Indian hams, despite attempts over a decade, have not succeeded in making their government accept any one body as representing their interests.

The Amateur Radio Society of India (ARSI) at New Delhi enjoyed a monopoly as the only country-wide organisation for over 20 years, but it specialised only in needling the WPC (Wireless Planning and Coordinating—a Wing of the Ministry of Communications), which is our licencing body, corresponding to the FCC in the U.S. It did not establish the type of healthy rapport that most IARU member societies enjoy with their governments. As the membership grew, this society became a hotbed of controversy, leading to a split and the establishment of the Radio and Electronics Society of India (RESI) at Bombay.

While refusing to recognise RESI as the sole representative of the amateurs (although it had on its rolls a majority of the licenced amateurs of the country), WPC suggested that it would recognize a federation of the various societies. However, when the Federation of Amateur Radio Societies of India (FARSI) was formed by all the societies except one (ARSI, naturally) and asked for recognition, WPC resiled and began to talk to *all* comers. This encouraged a number of aspiring leaders to claim to better represent the interests of amateurs than both FARSI and ARSI.

One of these was a small society based in Hyderabad, which, with some patronage from the ruling political party, sponsored a National Institute of Amateur Radio (NIAR). It was sanctioned by being awarded a grant of over ten million rupees [in 1984, slightly under a million U.S. dollars], a fourth of which was paid out, with the avowed purpose of promoting amateur radio in India. After two years, the government decided that it had waited long enough for results and began looking around for a new "apex" body upon which to bestow its financial favours.

The concerned government departments sponsored an unofficial seminar on April 12 to identify a new apex body. The outcome is reported to be a synthesised body called the Indian Council of Radio Amateurs, made up of representatives of the Department of Electronics, WPC, FARSI, NIAR, and five amateurs, VU2CPJ, VU2SDN, VU2KAJ, VU2KV, and VU2BSN. The objective of this apex body is stated to be limited to acting as a link between the amateurs and the government, and as a channel for disbursing the government's monetary benevolence.

To what extent this body will succeed in promoting amateur radio will be revealed by the efflux of time. Meanwhile, FARSI continues to represent over 60 societies, run a QSL Bureau, and publish its monthly journal, *Radio*. All this leads the ham-in-the-street to wonder whether an apex body can be imposed from above, by the government's fiat, or whether it should be built from grass roots by the support of its members.

REPUBLIC OF KOREA

Jongho, Yi HL1AFP
#1691–19 Bongcheon 6 Dong
Ga–Gu, Seoul 151
Korea

We welcome with pleasure Lee HL1AFP, our new correspondent for the Republic of Korea (South Korea). Now we will be able to catch up with developments since April of 1985, when we last heard from "the land of the morning calm." He writes us, "My English is very poor, I believe you will be re-editting very nice sentence, I really hope so." No way should that sentence be changed: It says exactly what it means with all the clarity one could desire and with more clarity than much that is written today in technically correct English. Lee's phone number is 884-9526 if you are in Seoul; dial 02 first if you are in Korea but not in Seoul; dial 82, then 02, then his number if you are direct dialing from abroad.

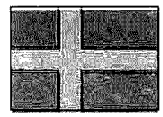
ASIAN GAMES CALL

My first news for you from the land of morning calm, Korea, is the special callsign, 6K86AG, for the 10th Asian Games to be in Seoul. We will use this call for 35 days, from 1st September to 5th October. We will be located at the KARL shack (Korean Amateur Radio League) from 1st to 19th September and at the main stadium for the games for the rest of the period.

We plan a Ham Press Center at the stadium and hope to be able to be helpful for foreign participants in the Asian Games at 6K86AG. I will be an operator there. Korean hams will be able to use 86 in their

AG PREFIX LIST

A4, A5, A6, A7, A9, AP, BY, DU, EP, HM, HS, HZ, JA, JT, JY, OD, S2, V8, VS6, VU, XV, XW, XZ, YA, YB, YI, YK, 4S, 4W, 70, 8Q, 9K, 9M, 9N, 9V, and HL.



calls for the special callsign period—I can use HL86AFP, for example.

ASIAN GAMES AWARD

Available to all hams/SWLs worldwide, for the period of the Asian Games: HL-class award for those making contacts (heard) with (from) ten HL stations including at least one HL1 (Seoul) station; DX-class award for those who made contacts (heard) with (from) ten countries participating in the Asian Games, including HL, but contact with a station in one's own country will NOT count.

The commemorative station, 6K86AG, or any one HL86--- station and the Commemorative QSL cards will count as equivalent to five HL stations or five participating-country stations, whichever is applicable. (See box for prefixes of participating countries.)

Send Won 2,000, US $4, or 10 IRCs with GCR before December 31, 1986 (for HLs) or before September 20, 1987 for all others, to Korean Amateur Radio League, C.P.O. Box 162, Seoul 100, Korea.

RFI CAUSES POWER RESTRICTIONS

Interference problems caused by the lack of rf-immunity in home entertainment equipment is a major threat to ham radio. A recent RFI case here in Sweden indicates that the licensing authority is changing attitudes towards the radio amateur.

Up to the beginning of the 1970s, interference (TVI, BCI, RFI) was always blamed on the ham operator. During the 1970s, a slight change developed: If a device was not a radio or TV receiver but just an amplifier (tape recorder, stereo amplifier, telephone, and the like), the interference was not claimed to be the radio amateur's fault. He still had to cope with the neighborhood problems, though. In some cases the manufacturer of home entertainment equipment helped out, supplying and even installing filters for better rf rejection.

	1983	1984	1985
DL	136	177	137
LA	67	81	82
OZ	34	37	32
PA	32	20	26
W	24	21	21
G	17	22	21
Others	33	44	17

Table 1.

In fact, it is improper to talk about interference when the fault is in the unit itself, due to poor design. However, everybody talks about interference caused by the ham transmitter although the problem is produced within the interfered unit.

Early this year, a Swedish ham had heavy power restrictions imposed upon him because of interference in video recorders when he was transmitting. Video recorders are our new problem area, and you can never know when your neighbor is watching. On the 80-meter band, this ham is allowed a maximum output of 0.3 Watts (300 milliwatts)! Certainly there are QRPp fanatics who use such low power at times, but they do so on their own. To be forced to close down ham radio activity due to deficiently designed video recorders is outrageous and a threat against ham radio entirely.

This is a worldwide problem, and I would appreciate very much to receive any input on how this is handled in other countries. I am a member of the EMC working group in our league SSA.

THE FRO AWARD

The Swedish voluntary radio organization, FRO (Frivilliga Radio Organisationen), is celebrating its 40th anniversary in 1986. FRO is administered by the military service but most members are non-military. The Swedish military club stations are indicated by the prefix SL, and all FRO stations have in addition the letter Z as the first suffix letter, e.g., SLØZG, SL2ZYK; then there are the special stations: SL-FRO.

The FRO-40 Award may be won through contacts with FRO stations between May 24 and December 31, 1986, adding up to 40 points, as follows:

- Contacts with 7S1FRO, 7S2FRO, 7S3FRO (etc., one for each call area) are worth 5 points for Europeans, 10 points for DX; Contacts with SL-Z— or SL-FRO stations are worth 1 point each for Europeans, 3 for DX.
- All bands, including 10, 18, and 24 MHz are valid.
- Count each station once on each band, regardless of mode.

Mail your application with QSL cards, GCR list, and 30 Swedish kroner or U.S. $4 or 10 IRCs to FRO, Riddargatan 13, S-114 51 Stockholm, Sweden.

VISITOR STATISTICS

We hams always like to bring our radios with us wherever we travel. Thanks to reciprocal licensing agreements between various licensing authorities, we are able to obtain short-term visitor licenses in many countries. Sweden, however, does not require a mutual agreement for issuing a visitor license here. In European countries, these tickets usually are issued for three months and a fee is charged. In many cases, an application should be sent three months in advance. Hopefully, all this will soon be simplified by the so-called CEPT license that is supposed to be valid in most European countries without separate applications. Some countries, like Norway, Denmark, and West Germany, are in the process of accepting the CEPT concept.

During the last three years, Sweden has issued visitor licenses to hams from some 25 countries (see Table 1).

SM ON TOP BAND?

A handful of Swedish hams have been very successful on the 1.8-MHz band despite the restrictions we have, i.e., narrow band 1830–1845 kHz and only 10 Watts input. However, good antennas have helped. If you want to work Sweden on the Top Band, get in touch with Jan Skoldenberg SM5DGA, Backv. 13, S–752 52 Uppsala, Sweden. Jan is very active on that band and has current information on the others who also have good capabilities for 160 meters. Please be sure to enclose an SAE and IRCs if you wish him to send you any information.■

HAM HELP

We are happy to provide Ham Help listings free, on a space-available basis. We are not happy when we have to take time from other duties to decipher cryptic notes scrawled illegibly on dog-eared postcards or odd-sized scraps of paper. Please type or print your request (neatly!, double-spaced, on an 8-1/2 x 11 sheet of paper and use upper- and lower-case letters where appropriate). Also, please make a 1 look like a 1 not an l—which could be an el or an eye, and so on. Hard as it may be to believe, we are not familiar with every piece of equipment ever manufactured on Earth! Thanks for your cooperation.

I would like to purchase a Fisher Model MPX-20 externally powered 4-tube multiplex adapter or a substitute for same. Will pay any reasonable price and expenses. Phone only if you have one: (216)-481-0274.

Herb Schieman KA8AZW
1910 Beverly Hills Drive
Euclid OH 44117

I need any information (schematics, manual, etc.) for the following frequency counter: BOHSEI Frequency Counter, M 7505, 10 KHz–30 MHz, Ebina Electronics Corp. Will pay any costs or copy and return.

Robert Carson Jr.
Box 364
Smithfield OH 43948

I would like to obtain the following Teletype bulletins: 120B, 252B, 254B, and 1044B.

C. T. Huth
229 Meimore St.
Tiffin OH 44883

Can anyone help me get a copy or photocopy of the owner's or service manual for my Hallicrafters S-120 shortwave receiver? Please write and let me know the cost before sending. Any help will be appreciated.

Steve Guelzo
318 Oak St.
Elgin IL 60120

I require service information for a pocket-sized VHF transceiver, model TR1007 by Rank Telecommunications, and also for a CHA Canadian Motorola VHF receiver base station. Any help is appreciated.

Errol May
R1 Lasalette
Ontario N0E 1H0 Canada

I need a schematic and/or owner's manual for a Dycomm 2-meter amplifier.

Karl Steinbach V.M.D.
PO Box 28
Harborton VA 23389

I need a manual and schematic for a Drake R-4, serial #1526. I will pay for shipping and/or reproduction. Let me know what you have.

Gary Mitchelson
295 I Snow Cap Court
Glen Burnie MD 21061

Please help me rehabilitate two CB amplifiers for use on 10 meters. I need schematics, manuals, or first-hand accounts on how to accomplish this. The two amps are:

The Squire 125, Electronics Unlimited, Lebanon, Tenn. (12 V dc) and

Marko XB-100, Cobra CB Radios (110 V ac).

I'm willing to pay reasonable costs for copying information on the above, or you can send material to me and I'll copy and return it.

Mel Riffe WD8NNL
4908 Western Rd.
Flint MI 48506

I need manuals, schematics, or information concerning a Hammarlund HQ-110 receiver, Hallicrafters S-40-B and S-38-A, Crown SX-711 tape recorder, and Crown International two-track tape recorder circa early '60s. In return, I have manuals for Hammarlund HQ-140-XA, Ampex 403 tape recorder (early '50s), and CQ "Command Sets" manual. Will copy sections you need.

NEVER SAY DIE

from page 84

bring you $20 for a hundred readers.

As I mentioned a couple months ago, if I were a club looking for a newsletter editor, I'd start by finding out who has a Macintosh. The likelihood is that someone will have one. . . unless your club has been particularly nasty about getting youngsters to join. Old fogies are seldom Macintoshers. Even a C-64 can do the job, and I know you've got a few of those spread around the club.

You can get members with computers to zip in their copy via the club two-meter repeater. . . or by modem over the land line. You want to get reports into the newsletter on what DX your DX fanatics have worked recently. It's no good working it if you can't brag about it. You'll want a report on recent contests. Certificate hunters can brag on their latest wallpaper.

If anyone has sprung for the newest in ham gear, get 'em to write about it. You know they're busting to, if only you'll ask. And get 'em to bring it to the next club meeting so they can bask in the admiration of the less fortunate.

You'll want a report on slow-scan doings. . . what's new in RTTY countries. . . repeater news of new stations and channel changes. Has anyone made an interesting trip and brought back some slides or videos? I'm certainly not the only ham who gets off to interesting places.

Bermuda, For Instance. . .

In May I got over to Bermuda for a week for a President's Association conference. I had visions of basking on the beach. . . even took my suntan lotion, swim fins, mask, and Nikonos camera. The stinkers had sessions from 8 a.m. until around 7:30 p.m. almost every day! I came back as lilly white as I'd left. But I did get together with the VP9ers one night when they happened to have a club meeting. What a great bunch of hams! The .94 repeater covers the island so well I was even able to make contacts while riding in a taxi from the airport.

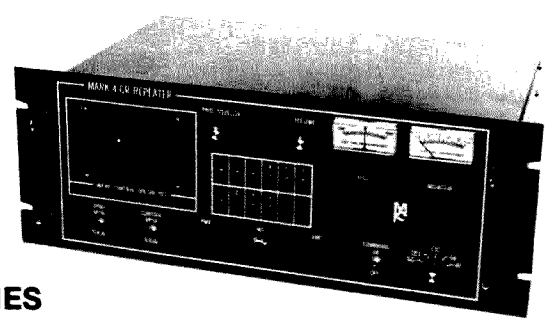
If you write ahead, it's easy to get a temporary operating permit, so W2NSD/VP9 hit the pavement running, HT in hand. You know, if you make a serious effort during the yearly Bermuda contest, you can win a trip to Bermuda to get your certificate! The club gets stations set up in every one of the nine Parishes and offers certificates if you contact all of 'em.

Bermuda is only an hour and a half flight from the East Coast, so you might start thinking in terms of giving it a try for your next vacation. The main (and almost only) industry is tourism, so you're going to have a good time. There are hotels and restaurants that cater to the rich, but there are plenty for the rest of us, too. I'm about as chintzy as they come, so I naturally seek out the better bargains. Sherry and I found a delightful restaurant on Front Street—it not only provided the best meal we had on the island, it was one of the most reasonable. . . the Longtail Restaurant. We were disappointed by the highly touted Green House at the Sonesta Hotel, Tio Pepe's, and Henry VIII.

You get around on Bermuda by moped or scooter. Since I've got a Yamaha scooter of my own, I went for the scooter. The speed limit is 20 mph for the island, but you have to go more like 30 to keep up with the taxis. The roads are all narrow, few with any shoulders. . . unless you call a ten-foot high sandstone wall a shoulder. Being a British island, the traffic is on the wrong side of the road, adding to the confusion. But the locals are used to thousands of mopeds and scooters in the hands of visitors, so they give the red license plates a wide berth and expect the worst at any intersection. There are surprisingly few accidents.

They don't have rental cars, so you either get around by taxi or by scooter. I preferred the freedom of the scooter, so Sherry and I covered the entire island with her clinging to my back. We did hit one short rainstorm. I just had on a shirt, so I got wet, but she didn't. I zipped under a big tree and waited a few minutes and the sun was out again and I quickly dried off.

here is the next generation Repeater



MARK 4CR

The **only** repeaters and controllers with REAL SPEECH!

No other repeaters or controllers match Mark 4 in capability and features. That's why Mark 4 is the performance leader at amateur and commercial repeater sites around the world. Only Mark 4 gives you Message Master™ real speech • voice readout of received signal strength, deviation, and frequency error • 4-channel receiver voting • clock time announcements and function control • 7-helical filter receiver • extensive phone patch functions. Unlike others, Mark 4 even includes power supply and a handsome cabinet.

Call or write for specifications on the repeater, controller, and receiver winners.

Create messages just by talking. Speak any phrases or words in any languages or dialect and *your own voice* is stored instantly in solid-state memory. Perfect for emergency warnings, club news bulletins, and DX alerts. Create unique ID and tail messages, and the ultimate in a real speech user mailbox — only with a Mark 4.

The Program Chairman

Oh yes, I was writing about clubs, so let's get back to the program chairman's job again. You want action at the meetings. Whatever you do, don't let business meetings intrude on the fun. Business meetings are not fun. No, I don't care how involved the members seem to get, if you allow business to take much time, you're going to quickly thin out your club.

Part of the program is the show and tell of DXers with their silly DX QSL cards. Part is the contesters telling about an upcoming contest or how they did in a recent one. Get 'em to bring in their award certificates and show 'em. The certificate hunters will also oblige with this. How about a short slide show by your SSTV member, showing some recent DX he's worked? Find out what special interests your members have and keep after them to tell what they've done lately. This will spur them on to more and more activity. It'll also get other members interested in joining the fun.

Do you have a weekly club meeting over the repeater? This is where you can line up the talent for the next meeting. This is where you can find out who has been doing what and get them all set to show and tell at the next meeting.

This repeater meeting will help keep interest in the club high. It'll also make it possible for you to have special meetings on short notice. This also helps keep club interest high. In this case, I recommend you drop cards to every ham industry firm asking 'em to give you a call if a key person from the firm is going to be in your area in the future. Tell 'em you'd love to call a special meeting just to meet them and find out about their products.

I know I get around the country a good deal, but I don't usually think in terms of the local clubs arranging a special meeting for me. So I sit in a hotel room, wasting my time writing editorials or catching up on my reading. If I knew ahead of time the name of the club president or program chairman, I'd be able to give a call and see if a special club meeting could be arranged where I could meet everyone and give a talk. I'm ready, day or night, to talk... at length. I once managed six hours of talking in one day while visiting South Africa... giving talks for television, computer professionals, computer hobbyists, entrepreneurs, and hams. Whew!

So I'd suggest you plan to be able to gather ad hoc club meetings to fit the schedules of ham industry luminaries rather than trying to make do with just the few who are near enough to fit into your regular schedule. Between your club newsletter and your weekly repeater meeting, you should be able to get the word around and provide good turnouts.

Unless the ham industry people know you exist and are interested in them visiting your club, they'll get to your area on a business trip and you'll miss 'em. Tell you what, if you'll send me the name of whom to contact and the phone number, I'll run a quarterly list in *73* of clubs anxious to organize special ad hoc meetings for industry people. Let me know about how many reasonably live bodies you think you can muster on relatively short notice.

I happen to know the industry people do get around because every now and then they go as far afield as Peterborough. (You know, you could do worse yourself the next time you're vacationing in New Hampshire. Bring your QSL card and post it in the *73* offices. The offices are actually in Hancock, just north of Peterborough. When you call, we'll tell you how to find us.)

If you have someone who can act as a liason for visiting firemen... someone who doesn't get unelected after a few months... that's the best name to send me. Send it to Ad Hoc, *73* Magazine, WGE Center, Peterborough NH 03458. If you mark it to my attention, it could get lost for weeks while I'm off on a trip. So far this year I've visited Denver, Aspen, Miami, Orlando, Washington, Columbus, Dayton, Atlanta, Mobile, Tampa, Chicago, Dallas, New York, and Bermuda. Later this year I expect to be in Seattle, Vancouver, Vegas, San Diego, Quito, Lima, La Paz, Rio, Tokyo, Seoul, Taipei, Hong Kong, Kota Kinabalu, Bandar Seri Begawan, Kuching, Kuala Lumpur, Atlanta, San Francisco, Miami, and so on.

How about club mini-flea markets? Get that ham gear off the shelf... out of the drawer... out of the attic... out of the cellar. Get it to someone who can have fun with it. Have you tried a flea-market table as part of your club meet-

ings? It's a way to get some cash for almost anything. You might want the club to get a 10% commission on sales to build up the club treasury.

A *73* Table

Another way to scrounge some cash is to convince club members they'll enjoy reading *73*. We have a special club deal, if you're interested. Hey, none of this making up an instant club to get a discount, okay? I want to see a membership list, a club newsletter, or something. Write to Club Deal, *73* Magazine for the gory details. If you're going to have a hamfest, big flea market, auction, picnic, or something, you could do worse than run a *73* table.

I have a lot more ideas for you on getting your club into gear. But don't make me do all the work... if you try something and it's successful, drop *73* a line so we can pass your idea along to help other clubs grow.

ADS IN PERSPECTIVE

For some reason many hams have the feeling that selling things to hams is kind of tainted. Part of this probably stems from the ham urge to build our own equipment, which results in a subconscious annoyance when commercial ham gear is far better and cheaper than we can build. It perhaps generates an inferiority feeling which expresses itself subtly as envy and jealousy.

Then, too, there is the teacher's syndrome—we're nonprofit, so anyone selling things to us for a profit is taking advantage of poor, downtrodden us. This is the justification used by teachers for mimeographing and photocopying copyrighted books and making illegal copies of copyrighted software. It's okay for me to steal because I'm giving it to the poor—I'm Robin Hood. There's always been this feeling that it's okay to steal from the rich—they're different. After all, they've got plenty, so what's it hurt?

In the ham industry we don't have very many rich people. We have a hobby that has been running down for 23 years—where the average age of the ham is now 56—where newcomers dropped 8.5% last year and 7.9% the year before—a smaller and smaller market as more hams go into retirement and have to find a way to live on Social Security... which often means no more ham gear.

What on earth gets into someone to get into such a dying market? Of course the big firms today are Japanese. In Japan amateur radio is a huge hobby. They've licensed about five times as many hams as we have and there are ham clubs in every school in Japan turning out tens of thousands of young, eager hams. Their ham magazines are four times the size of ours. It's only logical for this to be the amateur radio capital of the world now.

Though the big firms are all Japanese, we still see hundreds of small firms—American firms—what about these? Most of 'em got started when a ham built something different. Ham friends then say why don't you make that and sell it? Often the ham will get together with a friend and decide to give it a try. They are amazed at how cheap parts are when you buy them in bulk—nothing at all like the prices for parts on a card in a Radio Shack—about the only parts source left these days for most of us, now that all the parts stores are out of business.

So two (sometimes three) hams start a company making something for packet radio, for repeaters, for slow scan, maybe an antenna. They run ads in *QST* because that's the biggest magazine. They get a few orders and requests for literature. They don't know a blessed thing about advertising, so their ads are lousy and their literature worse. They limp along, getting enough orders to keep in business. They try ads in the other ham magazines and find that some do better than *QST* and some do worse—a whole lot worse.

I've been studying advertising ever since I took a course in it at the Advertising Club of New York over 20 years ago. That was one of the most valuable courses I've ever taken, yet I know of no college with anything remotely like it—one of the reasons I'd like to get into the college business.

It turns out the basic rules of advertising are fairly simple. You also discover that surprisingly few people working in advertising know what the hell they are doing. Unfortunately, like learning almost any other skill, you find the normal human reflexes are almost invariably wrong. If you try to learn to ski by doing what comes naturally, you'll never make it. Ditto horseback riding, and so on.

So, since virtually no one in the ham business has ever learned the fundamentals of advertising, and since most ads in ham magazines are written by these folk, guess what? I'm not picking on ham manufacturers and dealers; we have the same situation in the computer industry.

The obvious move is to turn to a professional, right? Har de har. Yes, there are a few ad agencies that know what they are doing. Some are doing a beautiful job of advertising for their clients. But sadly, there are more agencies that are turning out ads that aren't selling the product. These often are highly paid agencies, too.

A chap I know hired a manager to run his new company. The manager hired on a very expensive ad agency. The ads were simply awful and, surprise, the product didn't sell worth beans. So the chap fired the manager, did the ads himself, got the product moving, and sold the firm for several million dollars. The new owner, despite warnings, went right back to the expensive agency and quickly brought sales to a halt. I tried to talk with the pompous blatherskite from the agency, but found no one really at home.

I'd like to give an advertising seminar for the ham industry, but I don't know of any place to get 'em together. I dropped a note to every firm in the industry suggesting meeting a day early at Dayton and got just one response. When you consider that the difference between an effective ad and a poor one can be well over a ten times difference in sales, I wonder.

One of the services I'm planning for *73* will be a reader vote on the ads. As soon as I can set up a computerized system for tallying the results, I'll have a way for you to tell the *73* advertisers which ads you find most interesting—and which are turkeys.

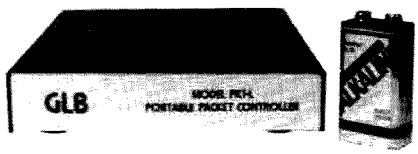
I don't have to explain the function of advertising in a ham magazine do I? The ham magazines are about the only way the ham industry can let you know what they're selling. Most of us are interested in buying new ham gear now and then. It's fun to get something new and put it on the air.

Half the income for ham magazines comes from ads, so they're critically important to a magazine's health. Very few hams are interested in paying double the current subscription prices for their magazines. In *73* my rule of thumb is that every two ad pages allows me to print another three pages of text—so the more ads, the fatter the magazine. We make our profits with our other magazines, so we can afford to run *73* at no profit. Remember, the main reason I took back *73* was to use it to get amateur radio growing again. I already have more than enough to do in what little is left of my life without *73*.

When we get amateur radio into a strong growth mode, there will be many opportunities for hams to start new enterpreneurial firms and do very well. During the computer growth years, we saw hundreds upon hundreds of new millionaires. Some kept it, some blew it. Some did incredibly well.

For those few of you who don't think making a lot of money is a terrible thing to do, there have never been so many opportunities to get rich as we have today—and hams have an edge. I'll be writing more about this if I get any encouragement. My past experience has been that most hams don't want to be bothered. Many feel so defeated that they can't even imagine gambling on something new, even in their spare time.

Of course I understand that many hams have no spare time. When they're not sitting there with an 807 in hand, maintaining their expertise with baseball, football, or basketball statistics, they are rag-chewing on 75m, grumbling about the QRM. If the shoe fits... remember that I started out with nothing but the guts to put everything I owned into printing the first issue of *73*. I worked very hard for years and went through several major traumas, seeing little success for the first 15 years. No complaints, I published *73* because I enjoyed it and the hundreds of hundred-hour weeks were both fun and agony.



Older hams may be starting to think in terms of some sort of business to run in their retirement. It's better than trying to live on Social Security and eating cat food. Some like the idea of a shop—some prefer a mail-order business since it offers much more freedom. There is no end to the potential small mail-order businesses, so if you're interested in that I'll try to write about it occasionally. It's up to you. If you prefer me to write about the awful band conditions all the time, okay.

If you do decide to go into business, for heaven's sake learn all you can about advertising—you're going to need the best ads you can get no matter your business.■

"When You Buy, Say 73"

GLB PACKET RADIO GOES PORTABLE

THE FIRST CONTROLLER DESIGNED FOR PORTABLE AND SOLAR-POWERED STATIONS

- LOW 25 mA Current drain.
- Miniature size—Lightweight.
- All metal, shielded enclosure.
- On-board Lithium Battery RAM backup.
- On-board watchdog for reliability.
- Standard DB-25 Connectors.
- Output signal indicates "Connected" Status.
- Does not require squelched audio.
- 8K RAM-32K ROM.
- Remote Command Mode for Unattended operation.
- Hardware command lockout for security.
- Commands compatible with our Model PK1.
- Retains all other features of the Model PK1.
- Extra I/O lines for special applications.
- AX.25 & VADC Protocols.

Model PK1-L
Wired / Tested
List price—$209.95
Amateur net—$179.95

Power requirement: 9 to 15 Volts DC @ 25 mA typical
Dimensions: 4.6 X 5.9 X 1.0 inches **Total Weight:** 12 ozs.

Please specify Call Sign, SSID Number and Node Number when ordering.

Contact GLB for additional info and available options.
We offer a complete line of transmitters and receivers, strips, preselector preamps, CW ID'ers & synthesizers for amateur & commercial use.
Request our FREE catalog. MC & Visa welcome. ↙17

GLB ELECTRONICS, INC.
151 Commerce Pkwy., Buffalo, NY 14224 716-675-6740 9 to 4

DEALER DIRECTORY

Fontana CA

Complete lines—ICOM, Mirage, KLM, Larsen, Astron, B & W. Over 4000 electronic products for the hobbyist. Also CB and business radios. Serving you from a 6000 sq. ft. store. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA

Bay Area's newest amateur radio store. New & used amateur radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1775A S. Winchester Blvd., Campbell CA 95008, 370-6665.**

Littleton MA

The reliable ham store serving NE. Full line of ICOM & Kenwood, Drake, Daiwa, B&W accessories. Curtis & Trac keyers. Larsen, Hustler, Telex/Hy-Gain products. Mirage amps., Astron P.S., Alpha Delta protectors. ARRL & Kantronics instruction aids. Whistler radar detectors. Full line of coax fittings. **TEL-COM Electronic Communications, 675 Great Rd. (Rt. 119), Littleton MA 01460, 486-3400/3040.**

Preston ID

Ross WB7BYZ has the largest stock of amateur gear in the Intermountain West and the best prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

New Castle DE

Factory authorized dealer! Yaesu, ICOM, Ten-Tec, KDK, Kenwood, AEA, Kantronics, Santec. Full line of accessories. No sales tax in Delaware. One mile off I-95. **Delaware Amateur Supply, 71 Meadow Road, New Castle DE 19720, 328-7728.**

Derry NH

Serving the ham community with new and used equipment. We stock and service most major lines: AEA, Astron, B&W, Cushcraft, Encomm, Hy-Gain, Hustler, ICOM, Kenwood, KLM, Larsen, Mirage, Mosley; books, rotors, cable and connectors. Business hours Mon.–Sat. 10–5, Thursday 10–9. Closed Sun./Holidays. **Rivendell Electronics, 8 Londonderry Road, Derry, NH 03038, 434-5371.**

DEALERS

Your company name and message can contain up to 25 words for as little as $150 yearly (prepaid), or $15 per month (prepaid quarterly). No mention of mail-order business or area code permitted. Directory text and payment must reach us 60 days in advance of publication. For example, advertising for the December '86 issue must be in our hands by October 1st. Mail to *73 Amateur Radio*, WGE Center, Peterborough, NH 03458. ATTN: Hope Currier.

September should bring some very disturbed conditions blended with excellent fall propagation on the HF bands. Expect an unsettled geomagnetic field on the 1st and 2nd, and an active field from the 5th or 6th through the 10th. We may see the return of significant sunspot activity—and possibly a flare! Earthquakes and volcanic eruptions possible around the 2nd and 11th.

G=Good, F=Fair, P=Poor, *=Disturbed magnetic field coupled with some unusual geophysical conditions (50–75% probability).

NEVER SAY DIE

Number 20 on your Feedback card

THE EARTHQUAKE

We're assured that one hell of an earthquake is coming to California—and fairly soon. The quake is inevitable, only the date is in question.

Further, we're told by experts who have put the data into computers that we can expect tens of thousands killed and at least a hundred thousand or so injured. Golly, it's almost enough to make a person think—so, making an unusually mighty effort, I thought. You don't want to know what I thought, it would only depress you. Why not skip on to the next break in my stuff—to something which is even more frightening to think about. Oh, I'm going to get your well-deserved guilt stirred up to a fever pitch.

Now, when the Big One hits, you know as well as I that two main things are going to happen. First, buildings will be crashing all over the place, killing and injuring an incredible number of people. Second, power, water, and telephones will be completely wiped out. And you know what that means—the *only* practical communications will be by amateur radio.

Repeaters, unless they have emergency power, will be out. It won't be possible to fix 'em because most roads and highways will be damaged beyond immediate repair. What roads there are left will be jammed with cars trying desperately to escape the area.

Ham communications will be the backbone of the disaster relief—making it possible for the authorities to contact each other—to send out rescue teams via motorcycles or helicopters—to get medicines delivered.

Hams will have to cope with hysteria, questions of who really is in charge, food, water, and medicine distribution, fire storms, gas leaks, floods from broken dams, bodies to be buried, injured needing medical attention, gasoline distribution, rioting, gangs of thieves, etc. Then, once the more serious emergencies are taken care of, comes the welfare message blitz—millions of people unable to use the telephones or get out of the area wanting to locate loved ones, family, and friends. Messages within the devastated area—messages coming into and out of the area. We're talking millions upon millions of messages.

We're not talking a handful of hams on 80m with hand keys tapping out messages at 10 wpm all night for a few days—we're talking tens of millions of messages over a period of weeks to months. We're not talking about anything we even remotely have in prospect right now in a message-handling system.

We're also not talking about what few hams we apparently are going to have left—probably with an average age of 60 or so. What few of you old buzzards who haven't ruined your lungs and body beyond repair with 50 years of smoking or carrying around 50 pounds of fat hanging over your belt may have the stamina to last for a few days, but that isn't going to cut it.

What you're going to give any-

EDITED BY PERRY DONHAM KW1O

Sweet Sweeps

THE BIG WINNER in *73*'s Powerhouse Sweepstakes is **Judi Booker N4NMH**. Judi has received her complete TM-2570A station and says she loves it! (See "Letters" in this issue for more from Judi.) Kenwood's Wayne Yoshida KH6WZ flew in from the West Coast to draw the lucky entry and visit with the *73* staff. If you didn't win this time, there's another opportunity for you this month: The brand new *73* **Megaband Sweepstakes** featuring Yaesu's FT-767GX is officially under way! (The entry blank is on page 81, but we encourage you to first read pages 1–80. We'd hate for you to miss anything important.)

Ten Returns

AMSAT-OSCAR 10 is feeling much better now thanks to the tireless efforts of AMSAT engineers. After two months of cautious diagnostics, the spacecraft's computer operating system was rewritten to avoid the areas of memory that were damaged by radiation. (High-energy particles traveling through the satellite can damage cells of memory; the number of damaged cells had grown too large for the computer's error-correcting system to handle.) **Karl Meiner DJ4ZC** produced the crucial memory map that showed which areas were faulty. The satellite is now in stable condition and running on a reduced operating schedule, with the hope that more user time will be available in the very near future.

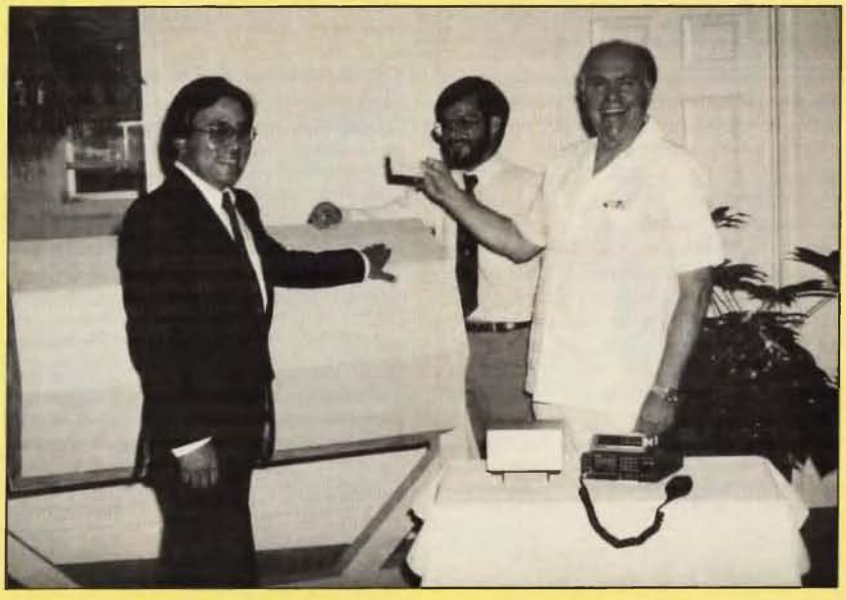
Packet Lunacy

TOM CLARK W3IWI has had success in bouncing packets off the moon using an 85-foot dish located at Gilmore Creek near Fairbanks, Alaska. 140 Watts into the 38-dBi-gain antenna yielded about 700 kW of rf at 432 MHz. While no connections were established, Tom monitored several time-stamped packets which displayed the 2-second round-trip delay. During the outing, 19 stations were worked on CW/SSB. Activities were cut short a few days due to the intense boredom produced by the lack of active stations.

Racy Award

THE REDCLIFFE RADIO CLUB of Queensland, Australia, has come up with one of the most complicated awards I've ever seen. It appears to be some sort of road rally done by radio . . . what you do is work cities in order along a circuit that travels all around Australia. There's some sort of bonus allowed when you do this in a certain amount of time, and time penalties just to make things interesting. Here's an example of how the rules read: "To encourage inland contacts, should the return to the coast be at the location where the coast was left and the second contact is not with the same station or if the same coastal station is worked after 48 hours have elapsed, the inland contact is worth an extra 50 points." I should point out that the award sounds really sharp; if you'd like to take a shot at figuring it all out, send an SASE to *73* Magazine, WGE Center, Peterborough NH 03458, Attn: Rally. I'll send you your very own copy of the rules.

ACC Expands



ADVANCED COMPUTER CONTROLS has moved to a new facility in Santa Clara, California. Their new address is ACC, Inc., 2356 Walsh Avenue, Santa Clara CA 95051; (408)-727-3330. A dedicated technical support line is also up at (408)-727-3414.

Go FAR

THE WINNERS of the 1986 Foundation for Amateur Radio scholarships have been announced. They are: James Baker KI4YN (John Gore Memorial, $900); Richard Westenberger N9DKR (Richard G. Chichester Memorial, $900); David Tancrell KB4GIA (Edwin S. Van Deusen Memorial, $350); Michael Kazigian KA2MRK, Leslie Ann Redman KA9PCV, Michael Silverglate KR9Q, David Swiatlowski KA2KLM, Diane Willemin KE8DJ, and Tony C. Wood KB4DNE (QCWA Memorial, $600 each); Douglas Swiatlowski KA2KMT (QCWA Robert Cresap Memorial, $500); Francis Horan KA3CJR (Radio Club of America, $500); Joy M. Davis KE8EG (Edmund B. Redington Memorial, $500); Carol Dunlap KA1NCX (Young Ladies' Radio League, $500); Michael Krensavage KA3CUP (Amateur Radio News Service, $750); Bernard Collins KA3FGV (Columbia Amateur Radio Association, $750); Christine Gray KA3NAR and Eric Smith KA3KJO (Baltimore Amateur Radio Association, $500 each); and David German N4FAD and Todd Wiggins KB4BDK (Dade Tropical Hamboree, $500 each).

Pool Rule

VOLUNTEER EXAMINER COORDINATORS have now been given the responsibility for maintaining the question pool used for ham license examinations. This latest action deregulating the volunteer-exam system was announced at a meeting between VECs and the FCC in mid-August. The Report and Order also specifies that volunteer examiners are the final judges to determine whether or not a question has been answered correctly. The volunteer examiner will also design each exam along guidelines set up by the VEC. The new rules are flexible enough to allow less traditional methods of giving a test, such as an interactive computer program which asks questions and immediately grades responses.

At the 73 Powerhouse Sweepstakes drawing (l to r): Wayne Yoshida KH6WZ, Perry Donham KW1O, and Wayne W2NSD/1.

Instant License

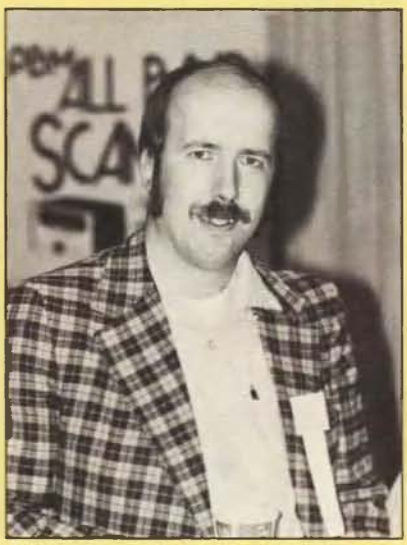
WE'RE A FEW STEPS CLOSER to an international amateur radio license, at least on this side of the world. The Inter-American Telecommunications Conference, a function of the Organization of American States, now has a draft of the **Inter-American Amateur Radio Convention**, a document that would set up a formal structure of reciprocal licensing between member nations of the OAS. The agreement will be presented to the Conference in November of 1987; meanwhile, OAS nations are being given the chance to make comments on the draft version. If the Conference gives the stamp of approval, it would be up to each individual government to ratify the treaty. A similar "universal license" is being worked on in Europe... will we someday see a single worldwide ham radio license?

Welcome!

THIS ISSUE of *73* sees the addition of three new columns and a new columnist. **Mike Bryce WB8VGE** is the new columnist; he takes on "ORP." **Ralph Taggart WB8DQT** of *The New Weather Satellite Handbook* fame will be keeping you up to date on... you guessed it, weather satellites in "WEATHERSAT." **Mike Stone WB8QCD**, Editor of *SpecCom Journal*, will be writing about amateur television in "ATV." And "DX" returns to the pages of *73* with an author every DXer knows but who has asked not to be named until next month. Hmm... I wonder if that means he doesn't want to be paid until next month? Don't forget to rate these new kids on the block by filling out the Feedback card and mailing it in—along with your subscription order, of course!

Here's Russ Rennaker W9CRC at his 80th birthday party... are you 80 feet up, Russ?

Captain Caught



CAPTAIN MIDNIGHT, the enterprising fellow who took HBO off the air for 4-1/2 minutes last April, turned out to be **John MacDougall KA4WJA**. John protested HBO's decision to scramble their satellite signals by overriding the HBO signal and displaying his own message across the country. The Justice Department and the FCC tracked MacDougall down by the process of elimination: Only two of the few earth stations powerful enough to do the deed use character generators that match the one used in the protest. The maximum penalty for transmission of a false satellite signal is a $10,000 fine and one year in prison; after plea bargaining it appears that the sentence may be reduced to a $5,000 fine, one year on probation, and the surrender of John's ham license for one year.

18 Or Bust!

THE AMERICAN RADIO RELAY LEAGUE has filed a petition with the FCC seeking early access to the 18-MHz amateur band defined in the last World Administrative Radio Council. The ARRL feels that there is plenty of room for U.S. hams on the band, and pointed out that the government has shifted its stations off of 18 MHz, and that the few nongovernmental users have long since vacated. Fifty-seven countries currently permit amateur activity on the band.

Hambassador

THE WINNER of the first **Ham Ambassador Award** sponsored by Advanced Electronic Applications is **Mary Duffield WA6KFA**. The award, presented at the 1986 ARRL National Convention in San Diego, is based on dedication to amateur radio, influence on non-hams, and the initiation of special projects and programs to promote our hobby. Mary is a 70-year-old retired schoolteacher who keeps herself busy by taking ham radio to the masses, including designing and running a for-credit class in ham radio at the Del Mar Middle School—a program chosen by the California School Administration as one that should be copied throughout the state. Mary was presented with $1,000 as a way of saying, "thanks."

Ralph Taggart WB8DQT, our new WEATHERSAT columnist. Welcome aboard!

SCRAN Plan

MEMBERS of the **South Coast Radio Amateur Network** (Torrance, Calif.) recently pulled out all the stops to provide communications for the California Special Olympics. Over the three-day event, 37 hams handled several thousand messages ranging from a request for paper cups to medical emergencies. A portable repeater was installed to provide reliable coverage over the UCLA campus. The Special Olympics are designed to give mentally handicapped folks "the opportunity to develop physical fitness, gain new friendships, express courage, and improve their self-image." SCRAN member Henry Schmidling WA6RJA reports that the amateur volunteers "received much more than they gave."

Section Election

THE ARRL EXECUTIVE COMMITTEE has decided to create a new ARRL section: West Texas. The effective date is January 1, 1987.

Finis

OK, enough of this stuff. Thanks this month for help from *Westlink Report*, *Gateway*, *The ARRL Letter*, *Amateur Satellite Report*, and *The W5YI Report*. Send your news items and photos to *73* Magazine, WGE Center, Peterborough **NH** 03458, **Attn**: QRX. See you next month!

Wayne W2NSD/1 took some time off to head north and operate VE7EXPQ.

NEVER SAY DIE

from page 4

thing for will be high-speed automatic communications systems using emergency-powered repeaters which will take typed messages and relay them where directed with no human help. We have the technology to set up such a system right now. What we don't have is the manpower to put it together and make it work. We don't have half the hams we need to set up the system we need.

According to the best count we have a bit over 400,000 licensed amateurs in the U.S. Of those it's estimated that 50% at most could even remotely be called active. It's more realistic to think in terms of maybe 100,000 fairly active hams. About 15% are in California—15,000 hams. At least two-thirds won't be near enough the disaster to help directly—leaving us with maybe 5,000 hams to handle several million messages. Sure.

Perhaps our best bet is to just give up—admit it's beyond us and wait for El Biggo to hit—then sigh and do the best we can with what little we've set up and accept a few thousand more dead as a result—hoping it won't be our family paying the price of our unpreparedness.

Now, The Nukes

A few months ago I mentioned the FCC's Long Range Planning Committee and its hope of setting up an emergency communications system which would be able to cope with the communications needs of a nuclear attack.

When the FCC found the ARRL directors adamant about stopping their move toward a no-code license, the FCC Commissioners could see no way for amateur radio to develop the million or so young hams it would need before it could organize the needed automatic high-speed communications system. They recognized that the few hams we have left—with an average age of 56, and aging fast—were hopeless.

I'm sure the ARRL directors never gave any consideration to the urgency of the emergency our country faces. Instead, they emotionally reacted, reflecting their own personal feelings rather than intelligence. The Commissioners were absolutely disgusted at this shortsightedness. They disbanded the LRPC.

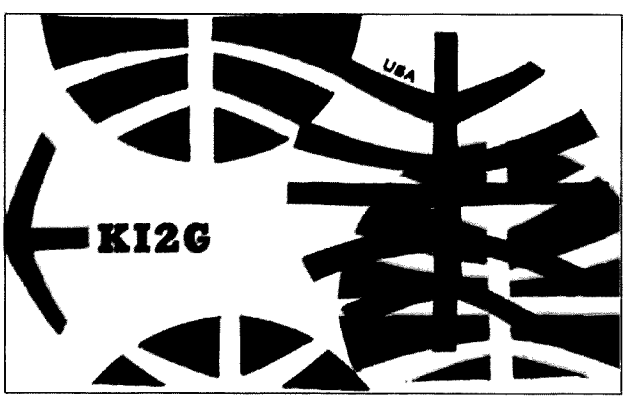
Since the thought of a nuclear war is so terrible that we generally just dismiss the possibility, there doesn't seem to be any real emergency involved. A nuclear attack is impossible—right? Heck, with a growing number of scientists predicting a nuclear winter which could devastate most of the world, we're sure that even Russia would never start nuking us.

Alas, there's one aspect of this which far too few people have considered. Frankly, I've given it a good deal of thought and I agree with a growing number of scientists that a nuclear attack isn't just possible, it's almost inevitable. No, make that inevitable. I don't see any way it can be avoided.

The nuclear attack I'm talking about will probably hit either New York or Washington—more probably New York City. And when is this expected? The probability is high it'll be within the next ten years—could be five. It's highly unlikely to be more than ten.

If you've been reading your scientific and news magazines, you know that they've got nuclear bombs down to where they can be backpacked into a country now. If smugglers can bring in hundreds of tons of drugs a year, I don't think they'll have a lot of trouble with a few pounds of nuke.

Where can they get a nuclear bomb? You've read about several students who have, just by researching declassified material, designed atom bombs which our nuclear scientists say would be quite effective. Anyone can make one if they have the materials.



We know Kaddafi was trying to build a reactor so he could produce weapons-grade materials. We also know he's a bit miffed with us right now. Then there's the reactor they're building in Iraq—not one of our best friends in the world. And another in Pakistan—one in India—China—Israel—France and so on. A dedicated group could seek out a weaker defended source and load up. Making the bomb and getting it into downtown Manhattan would be relatively simple.

In case it's skipped your attention, Israel's West Bank problem has spawned a growing number of fanatics—people who are dedicated to killing themselves and as many as they can take with them. There is no bargaining with these people. They're mad and they're not going to take it any more.

And if you figure that giving the West Bank back to the Arabs will help, please don't forget that there are a bunch more fanatic groups—many angry with America. New York City, where a nuke could wipe out two or three million people and injure 13 million more, is a very attractive target.

A few years ago I had a visit from a chap who had worked for me back in 1962. Nice chap. He'd gone into social work in Brooklyn. Well, he had a strange story to tell when he visited about 15 years

Number 18 on your Feedback card

THUMBS UP

I wanted you to know how much I enjoyed the July 86 [Clubs] issue of *73*—so much that I've taken a two-year subscription. There was so much of interest in there that I couldn't put it down all week while on vacation. Please keep up the good work.

Bud Gray W1HMT
Windham NH

THUMBS DOWN

Whoever decided to make August 86 [Packet] a one-issue magazine should be fired as a liability to Wayne Green Enterprises. I am paying for a *ham radio* magazine, NOT a computer magazine.

Dennis Bernier WA1WIA
Pawtucket RI

THUMBS UP

I am proud again to be a subscriber to a fine magazine such as your August 86 issue. Here in east Tennessee, packet radio has just begun to gain momentum. I have very little time to acquaint myself with the new and varied interests of ham radio. It is nice to pick up a copy of *73* and learn, first-hand, about these interests. It took a lot of courage to fill an issue of *73* with "pure packet," but I am glad that you folks were courageous. Your courage and your sense of adventure brought me back to *73* after a much too long hiatus.

John Dolan WC4M
Greeneville TN

THUMBS DOWN

You talk about getting new and young blood into ham radio—take a real close look at your August 86 issue. Do you really think a Novice or pre-Novice could understand one single word? Granted, packet radio is hot, but with whom? Amateur radio is a hobby . . . not a religion to be followed as the high priests (read old farts) dictate as the only road to salvation. What happened to the articles that could be read and understood by those who are new hams and those who wish to be new hams? What about easy, useful construction projects that some of us dumb bastards can understand? Let's have some of the old *73* and let's try to remember that we're all not electrical engineers.

Name withheld

"Pre-Novice" sounds like Cro-Magnon! Just because you couldn't figure it out doesn't mean that the rest of the world can't (excluding a few of the folks I hear on 75m). Packet is what a million young hackers are looking for . . . a new way to use their beloved computer. Trust me, they understand every word.—KW1O.

SWEPT AWAY

It was indeed a surprise when I received Stu Norwood's phone call informing me that I had won a Kenwood TM-2570A in *73*'s Powerhouse Sweepstakes. It was a surprise because I had not entered: My OM, Jim Wilcox K4JAP, had entered my name as well as his brother's. Needless to say, it was a great thrill to win such a great piece of Kenwood equipment.

I already have a Kenwood TH-21AT. It's been a very useful HT for me because it fits in my pocketbook and I can take it anywhere. Jim has a TS-930S. So you can see we're pleased with Kenwood.

We enjoy *73*, and I especially enjoyed the August 86 issue on packet, since this is an area I've become interested in lately. I haven't purchased any equipment yet, but the information in that issue will be helpful in making decisions. Keep up the good work.

Thanks for declaring me a winner. The TM-2570A is already up and running as a base station. Oh, and one last note: Jim asked me to say, "Welcome back, Wayne."

Judi Booker N4NMH
Falls Church VA

YOUNGEST YL

With regard to your QRX column in August, Her Royal Majesty Princess Raya of Jordan JY2RBH [born this year] has to be the youngest YL ham and perhaps the youngest licensed ham.

However, I congratulate Jill KA9VGW and wish her many years of happiness in ham radio.

John Manna WA2MTR
Bridgewater NJ

OK, how about "Youngest Active Non-Princess YL"?—KW1O.

THANKS, DI

Your artist, who signs himself DKR, has displayed a keen talent for showing us as we are. I'm talking about that picture on pages 36 and 37 of the July 86 issue. I hope we see more of his work.

Paul Schmidt W9HD
Bloomfield IN

DKR is Dianne Ritson, our multi-talented art director who designs our covers and does a hundred other tasks, too. Here's a look at Di.—KA1MPL.

W2NSD/Rx

Congratulations on your editorial regarding gutter language on the ham bands (June 1986). The treatment you prescribed is excellent, and I hope it is applied as often as needed. Keep up the good work.

Ivan T. Schultz K0GP
Humboldt IA

DEAR ARRL,

What a sad day it was when I opened my June, 1986, *QST* and found that the League has endorsed the proposal for enhancing the privileges of the Novice license! I don't really mind the 220-MHz and the 23-cm additions, but to give Novices 10-meter phone is preposterous! With the number of headaches and lack of control the FCC has faced from amateur radio as of late, not to forget the problems that the Citizen's Radio Service created, why can't Uncle Sam and the ARRL learn from past mistakes?

I certainly want more youngsters to enter amateur radio, and I speak first-hand since I entered as a Novice at the age of ten (I'm twenty-nine now). But the League certainly seems to be placing more concern on the quantity, rather than the quality, of new amateurs. With the declining number of Novices and declining ARRL membership, is the League taking the position that it is more important to stay financially secure and impress the government with the sheer number of licensed amateurs? I think the answer is yes.

A few phone privileges are fine; I can even remember using AM on 2 meters when I was a Novice. Use of CW and digital modes is great, too. But giving the Novices SSB in the 28.3–28.5-MHz segment is asking for trouble from the CB lids who will slide their 110% modulators up to the 10-meter amateur band and create chaos and frustration for *all* amateurs, both in the U.S. and abroad. The League has been so forward in preserving our precious band space, so why not support the use of the 50–54-MHz band for Novices, and increase the 6-meter population and justify our continued allocation that is threatened at this very moment?

Please, please reconsider the granting of 10-meter phone privileges to Novices, and put the emphasis on the *quality* of amateur radio operators, not simply the *quantity*.

Paul Passman WB0BBC
Lenexa KS

Of course the ARRL endorsed Novice enhancement—the ARRL proposed it! (Actually, there were a number of petitions before the commission regarding expanded Novice privileges, but the text of PR Docket 86-161 is essentially the League's.) And it must have been an exceptionally sad day when you opened up the June, 1986, issue of 73 and discovered that we endorse it, too.

We need Novice voice on ten meters so that they can get a taste of what it's like to operate SSB on HF. There's already a "Novice" license for six meters—our current Technician class. The Techs aren't exactly shoulder-to-shoulder on six; there's no reason to believe the Novices would populate it either.

Finally, you'd better believe

we're worried about sheer numbers. Maybe you haven't noticed, but amateur radio has experienced "negative growth" for the past several years. If something isn't done very quickly to reverse this trend, there soon will be nothing to stop the commercial radio concerns from taking the spectrum from us that they want so badly. In Washington, it's sheer numbers that count. —KW1O.

A/S OK

I would like to bring to the attention of your readers an exceptional amateur radio company, The Antenna Specialists Company of Cleveland, Ohio. After contacting A/S regarding a replacement part for my 10-year-old 5/8-wave, 2-meter trunk-mount antenna which had developed an internal short, I received the required parts free of charge in less than nine days. I am very impressed with this type of service and highly recommend A/S products to all.

Michael Weber WB8RDN
Sterling VA

GLASS HOUSES

Though once considered a man's hobby, amateur radio is now seeing a growing influx of YLs. Some narrow-minded OMs are voicing their concerns about the growing number of licensed YLs and the long-term effect on "their" repeaters. Many have expressed fears that the bands will soon be overrun by inexperienced YLs who will turn two meters into a glorified CB band filled with meaningless gossip.

To be adequately prepared for entering the world of repeater operations, I, a newly licensed Technician, turned to the FCC manual on Rules and Regulations. A basic description of repeater operation was given, and it also suggested that I monitor the local repeater to observe accepted operating procedures. The following is a list of accepted topics compiled from my monitoring. You may talk about:

- Baseball, football, cheerleaders, and the girls in the stadium
- Your favorite restaurant, the foods you are most hungry for, how long it has been since your last meal, and even recipes
- The weather conditions, amount of rainfall, and cloud formations
- The stars and the moon
- Car repairs, home repairs, or even vacations—but if you're a YL don't mention household chores or you'll be accused of trashing the airwaves
- Your wife's moods, dermatology problems, and dental problems
- Gardens, grandchildren, pets, or the old lady back at the QTH (I thought Q signals were for nonverbal communications)
- Golf, cycles, fishing, guns, or photography
- (On Sunday) church, choirs, attendance, ministers
- Road construction, the car in front of you, and the car behind you—but if you're a YL, don't mention that you're mobile chauffeuring children or you'll be accused of misusing the repeater

OMs are allowed to ask: What's up? What's happening? How are things with you? If you're a YL, you'll be accused of gossiping and it will be implied that you should stick to the telephone.

If something is funny, don't laugh or you'll be accused of being tacky. HI, HI is acceptable. Don't giggle or you'll be accused of flirting.

It is acceptable etiquette for an OM to sneeze, cough, clear his throat, or burp into a keyed mike.

We YLs worked just as hard as you did to get our licenses and we hold the same pride in our accomplishments that you do. We also are unimpressed with the CB mentality and want the ham bands to maintain the high standard of operation that first attracted us to this hobby.

So, OMs, please listen first before you cast stones.

Name withheld
due to lack of guts
(I'm no fool—I'm married to an Extra-class OM who subscribes to this magazine.)

QSL ESL

I teach seventh grade world history and English as a second language (ESL) at Horace Mann School in Beverly Hills. Last year I applied for a grant, and the State of California came through with some bucks for shortwave equipment for my classroom. Your tax dollars at work.

I bought an ICOM IC-R71A, an IC-R7000, and all the accessories. I put up a 42-foot trapped dipole for HF and a super-wideband discone for VHF/UHF. I have a lot of kids just listening right now, but this fall I hope to get a licensing class going.

Your efforts and ideas on attracting new blood into the amateur ranks are right on target. Get them at this age level. Increase Novice privileges. Develop and distribute a comic book. All good concepts.

A lot of hams simply take themselves too seriously. They detail their trivial daily activities. They're snobbish to the newcomer. They endlessly explain personal problems which are of very limited interest to anyone else.

After years of listening, I didn't finally get off my duff and earn a ticket just to join a dying hobby. I think things *can* be turned around.

Craig Dible KB6LAK
Marina Del Ray CA

Sure, there are a lot of dimwit ops—and it soon becomes obvious there's no sanity section in the ham exam—but with the right bait you'll find some charming chaps and have plenty of great contacts. Someday someone will write an article on how to sort out the wheat from the chaff. I hope.

The merciful thing is that a high percentage of the hams with little of interest to talk about make their QSOs short—merely repeating the same litany over and over for the rest of their lives. Give them their signal report and move on. They won't let you go without a signal report.

If you do have any success I expect you to write more than a nice two-page note. I expect an article so we can get more teachers suckered into following your lead. Poison their miserable little minds with the ham virus!

Your ESL groupies should really get off on shortwave, where they can fight off their immersion in English (except at home, presumably) for a few hours.

I have written.—Wayne.

PRODUCT REPORT RESULTS

The following is a compilation the Product Report cards we have received. Equipment is rated on a scale from 0 to 9, and the average rating for each product is shown. A piece of equipment is included in the list only if it has been rated by five or more readers.

NEW PRODUCTS

Number 21 on your Feedback card

Shure's 550L microphone.

The 4X4 digital oscilloscope from Rapid Systems.

Ameco is back with their Tunable Preamp Antenna.

NEW SHURE MIKES

Shure Brothers has introduced a new communications microphone to their line. The model 550L is similar in design to the well-known model 450, and is designed for base-station use. The mike is brown and silver and comes with an omnidirectional cartridge.

For more details, check Reader Service number 204.

RAPID SYSTEMS 4X4

A new digital oscilloscope peripheral for IBM-compatible computers has been announced by Rapid Systems. The 4X4, which retails for $1,995, features four channels of simultaneous sampling with a 32K data buffer on each channel. The A/Ds have programmable gains from 10 mV to 20 V per division, sampling rates from 0.1 Hz to 500 kHz, user-definable pre- and post-trigger buffers, and both analog and digital triggers. The menu-driven software includes a custom 140 x 288 color display, zoom from 1–2,000X, and a voltage cursor.

For complete details, mark Reader Service number 206.

SSB SQUELCH

A new voice-operated squelch module (VOS) has been announced by Naval Electronics. The VOS recognizes speech signals with a syllabic rate detector; when speech is present, the radio's speaker is turned on. The small board installs in most modern receivers and transceivers.

For more information, please check number 210 on the Reader Service card.

MIRAGE 1260 BEAM

A new yagi for 1260–1300 MHz is available from Mirage/KLM. The 1.2-44LBX provides 18.2 dB gain on a 12' 4" boom, with a wind load of only one square foot. Vswr is better than 1.5:1 over the specified bandwidth. The antenna requires no tuning and comes from the factory assembled and tested.

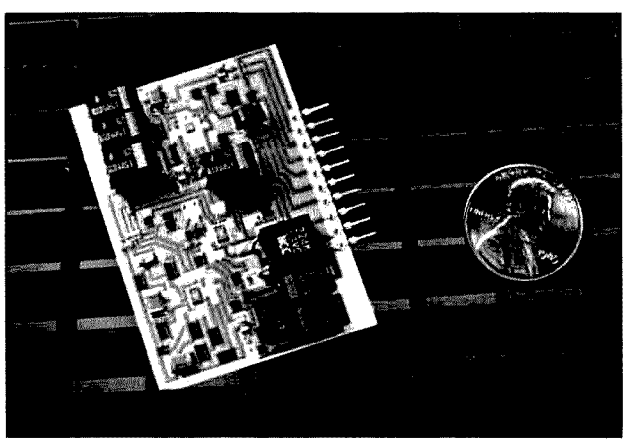
For complete details, check Reader Service number 203.

SAMS COOKBOOK

The third edition of the popular *IC Op-Amp Cookbook* by Walter Jung is now available from Howard Sams and Company. The book contains over 200 practical circuit applications, material on instrumentation amplifiers, information on chopper-stabilized drift-trimmed BIFETS, and an appendix of manufacturer's data sheets.

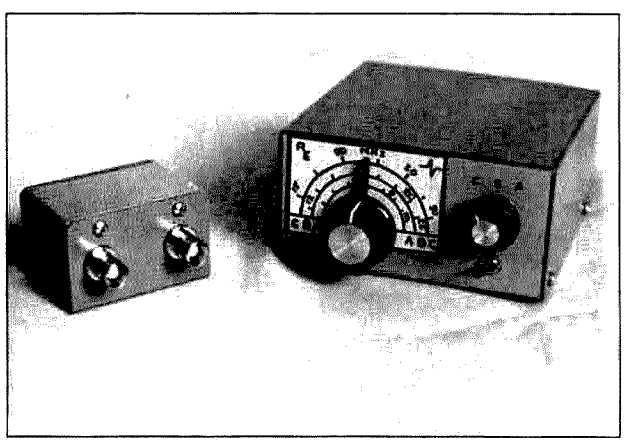
For more information about this and other Sams books, please check Reader Service number 205.

AMECO BRANCHES OUT



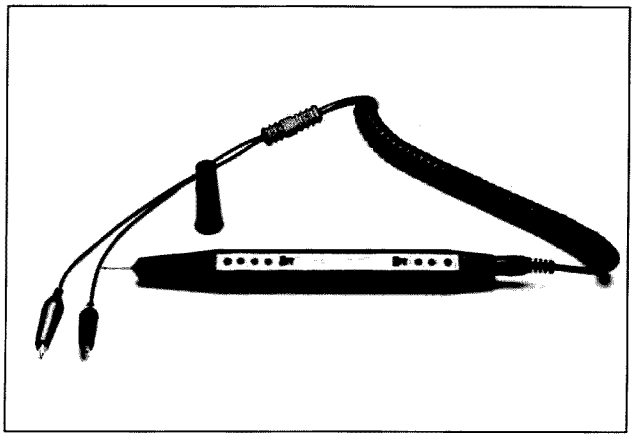
The familiar Ameco logo has resurfaced on their new Tunable Preamp Antenna. The TPA may be used both as a preamplifier or an indoor active antenna. The unit covers 0.22 to 30 MHz and uses a dual-gate FET for about 20 dB gain.

The TPA operates either on a 9-volt battery or an ac adapter (available for $7.50 from Ameco). The TPA, including a whip antenna, is $74.95. For complete details, mark Reader Service number 202.



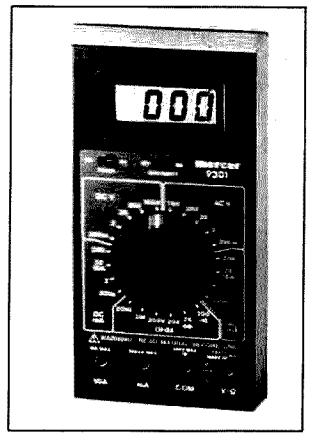
O-SCOPE FREQUENCY EXTENDERS

Radio Engineers has recently introduced two frequency extenders for oscilloscopes with low bandwidths. The HFX-1 contains an rf oscillator and a broadband mixing circuit to allow a 5- or 10-MHz scope to display signals of up to 55 MHz. The HFX-2 provides the same coverage when used with an external rf generator. Both units have an impedance of 50 Ohms and use BNC connectors.



For complete details, please

Voice-operated squelch from Naval Electronics.



Radio Engineers' oscilloscope frequency extenders.

Davie Tech's PRB-50 digital logic probe.

The Regency HX1500 55-channel VHF/UHF scanner.

The Mercer model 9301 DMM.

check Reader Service number 208.

WINNER'S EDGE SOFTWARE

Winner's Edge Software has announced a new module for their Contester II computer-aided contesting system. The CQWW module is designed for use during the *CQ* Worldwide phone and CW contests. It keeps the operator up to date on contest statistics such as running score and the number of QSOs and multipliers (both in the contest and on the current band), as well as automatically logging contacts, duping, and even sending CW.

The CQWW module ($16.95) requires the Contester II Basic system ($39.95) and a Commodore C-64 or C-128. For more information, check Reader Service number 214.

DAVLE DIGITAL PROBE

Davie Tech's model PRB-50 digital logic probe tests the logic state of TTL circuits, as well as under- and over-voltage conditions in CMOS and other voltage-sensitive ICs. The unit indicates signals up to 50 MHz and has a pulse width sensitivity of 10 ns. The probe operates on from 3 to 18 V dc.

For complete details, check Reader Service number 211.

XCELITE STRIPPER

Xcelite is now marketing an automatic coax-stripping tool which removes outside insulation, braid, and dielectric simultaneously or one at a time. The unit handles RG-178 up to RG-6 with color-coded cassettes which slip in and out of the tool in seconds. Pre-adjusted models are also available for single-size applications.

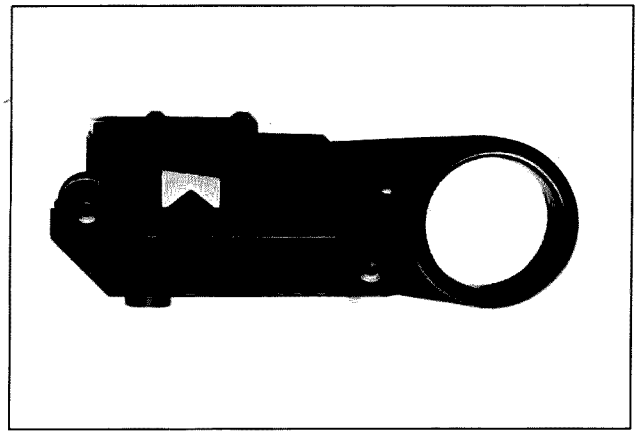
For more information, please check Reader Service number 212.

REGENCY HX1500

Regency Electronics has announced the HX1500 55-channel hand-held VHF/UHF scanner. The HX1500 covers 29–54 MHz, 118–174 MHz, and 406–512 MHz. Stored channels may be grouped into any of four banks for ease of access—all of the police channels in one bank, repeater pairs in another, and so on. Other features include dual scan speed, a priority channel, scan delay, and direct channel entry from the sealed keypad. The HX1500 retails for $369.95.

For complete details, mark number 213 on the Reader Service card.

MERCER 9301 DMM



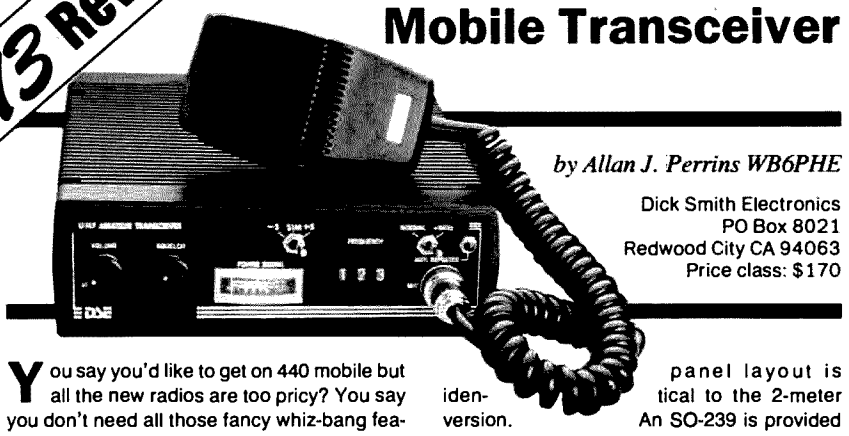
Mercer Electronics, a division of Simpson, is now offering the model 9301 DMM ($69), a 3-1/2 digit general-purpose instrument with 0.25% accuracy on all dc ranges. It measures up to 1,000 Volts dc, 750 Volts ac, 10 Amps ac or dc, and 20 megohms. Resolution is 100 uV, 0.1 uA, and 0.1 Ohm. Other features include an audible continuity checker, a diode test position, and a battery life of 2,000 hours.

For more information on this and the entire line of Mercer products, check number 207 on the Reader Service card.

FREE HEATH CATALOG

The new Heathkit catalog is now available. Completely redesigned, this edition includes many new kits, as well as a line of beginner's kits priced at less than $5.

For your free copy, check Reader Service number 209.



Xcelite's new coaxial stripper.

Free catalog available from Heath.

73 Review

Dick Smith 440-MHz Mobile Transceiver

by Allan J. Perrins WB6PHE

Dick Smith Electronics
PO Box 8021
Redwood City CA 94063
Price class: $170

You say you'd like to get on 440 mobile but all the new radios are too pricy? You say you don't need all those fancy whiz-bang features like scanning, programmable offsets, priority channels, and memories? Well, how about a good, basic, no-frills radio for less than $170. There is a catch—it's a kit.

Dick Smith Electronics has introduced a 440 companion to their popular 2-meter kit. This is a newly designed radio, not just a retrofit of their Australian model (they use 430–440 in Australia).

Full coverage from 440 to 450 MHz is provided in 5-kHz steps with a switch for ±5-MHz transmit offset or simplex operation. Also provided is a momentary push-button labeled "Anti-Repeater" that allows you to monitor the repeater's input frequency to see if you're within simplex range. Ten Watts of power out is nominal; typical receiver sensitivity is around .4 uV or better.

The kit comes complete with a mobile mounting bracket and a standard microphone. An optional 16-button DTMF microphone will be available soon. A matching base-station power supply is also available (K-6310—$39.95).

No provision was made for subaudible tone (PL) but a modification to add it will be outlined in the construction part of this review.

Appearance

The front and rear panels are die-cut from PC board, painted, and silk-screened. Front-panel layout is identical to the 2-meter version. An SO-239 is provided on the rear panel for the antenna connection, but purists may wish to replace it with an N connector. There is also an external speaker jack. The case is the same as the 2-meter kit—black plastic with an adjustable mounting bracket. The microphone provided, although comfortable and stylish, is internally baffled and designed to be a "communications" type with very limited response. More on this later.

Circuit Analysis

Don't worry, I'm not going to get complicated. Refer to the block diagram (Fig. 1) and follow along. By the way, a detailed theory of operation is included in the manual, which helps in troubleshooting.

The synthesizer is a modification of a basic PLL. The reason for this is that it is not practical to divide a binary number corresponding to 440 MHz directly. Instead, an offset oscillator is used so that the difference between the vco output frequency and the offset oscillator will be divided by a selected number (front-panel thumbwheels) and then compared to the reference oscillator in the PLL phase comparator. In this case, a 10.24-MHz oscillator is divided by 2,048 to give a reference of 5 kHz. The resultant error voltage is used to "steer" the vco to the proper frequency output.

The vco operates at a nominal 220 MHz. It is doubled to provide a 420-MHz signal, which is used in the receiver as the first i-f. Antenna input to the receiver passes through a two-section helical resonator, then enters an rf amplifier. From there a second two-section helical resonator feeds the mixer, where the input signal is converted to 21.4 MHz. A single IC performs the second i-f functions as well as squelch. A conventional audio amplifier drives the speaker.

In the transmit mode the same vco signal is also doubled to 440 MHz and is bandpass-filtered by yet another two-section helical resonator. This removes any trace of the 220-MHz vco signal from the output. The signal is then amplified to approximately 300 mW to drive the power amplifier module to a nominal 10-Watt output.

Microphone audio is amplified and limited, then a sample of audio is routed to a varactor diode in the vco circuit to produce FM.

Diode switching is used in the antenna filter network to handle the T-R chores.

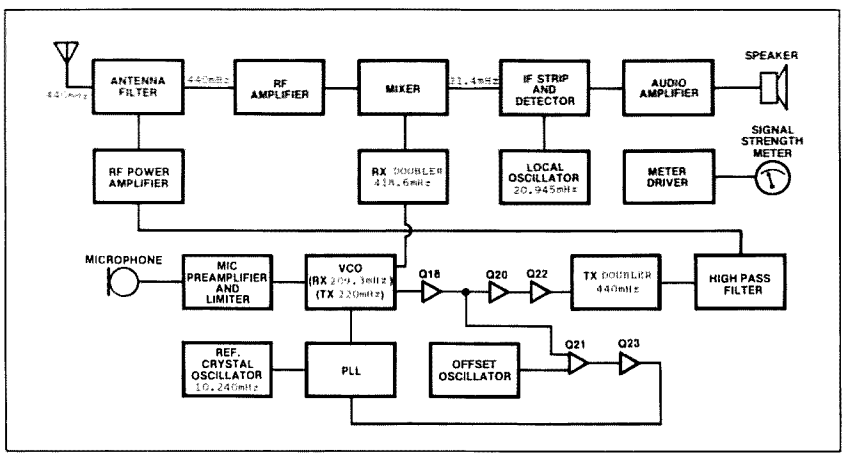


Fig. 1. Block diagram of the DSE 440 mobile rig.

Construction

As the Dick Smith ad states, "This kit is for advanced builders only!" And, I might add, not for the timid, either. When your kit arrives, you will find lots of bags of parts. Forget your preconceived "Heathkit" notions of parts being in coded bags—these aren't. Of course, you're also not paying someone to put those parts in the coded bag, either. If you're a little slow with resistor color codes now, you won't be by the time you finish this kit.

Many of the coils will have to be fabricated by the builder. This really isn't as hard as it sounds. Just use a drill bit of the proper diameter as a winding form. Take your time and refer to the drawings in the manual. When mounting the coils, keep the leads short.

This is a complicated kit and component layout is rather dense, so before you start construction I suggest that you read the manual from cover to cover three times. Be sure to read the errata sheet as well. It contains additional information on construction and alignment. When you finally get the soldering iron warm, repeat to yourself "take your time, do it right" ten times aloud. If you are not sure where a part goes, skip it for the time being and go back to it later when the rest of the parts in the area have been installed. Remember to check off in the space provided the parts you have installed. Don't forget to install all the jumpers (they're called "links") shown on page 54 of the manual.

If you choose to socket the DIP ICs, be sure to use a very low profile socket for IC2, as it is directly under the front-panel thumbwheel assembly. I didn't, and ended up having to change it later when I tried to mount the front panel.

Speaking of the front panel, the instructions are on page 55 of the manual and the wiring is on page 66. Same thing with the back panel—instructions on 56, pictorials on 55 and 67. I found this a bit inconvenient. The manual for the 2-meter rig was much better in this regard. DSE informs me that the second printing of the manual will have these pages rearranged to be less confusing.

Only tack-solder the front and rear panels

until all alignments have been completed and the unit has been fully checked out. I made that mistake as well, and desoldering one of those panels was not fun. While on the subject of front/rear panels, if you need more than one PL frequency, you might want to add a stereo mini-jack on the rear panel for an external encoder. Of course, you could always cheat and use the external speaker jack—as I did.

And speaking of PL, the place I injected tone was the junction of R22 and R23. The wiper of the deviation pot could also be used. Use a piece of shielded cable to connect to the rear-panel jack. If you need only one PL frequency, secure the encoder (using double-sided tape) to the inside of the same case half as the speaker and connect it using shielded cable. Switched TX voltage can be taken from either side of R149.

Alignment

The alignment instructions are very good and no problems should be encountered, assuming the unit was constructed properly. Presetting the small red variable caps can be a little tricky, so pay close attention to the drawing in the errata sheet. You should be able to attain reasonable receiver sensitivity doing the adjustments with a weak over-the-air signal, but alignment using a signal generator is preferable if you have one available. My unit ended up at .3 uV for 12 dB Sinad, which is more than good enough for repeaters.

Transmitter alignment should not be attempted with a dummy load mounted on the back of the radio! Rf will leak back into the radio and will interfere with PLL adjustments. Locate your dummy load about three feet away and you won't have any rf feedback problems. Be sure to perform the broadband transmitter alignment (page 64 of the manual) carefully and don't forget the additional step included in the errata sheet. If you do it right, the power should be just about flat from 440 to 450. Mine made 12 Watts across the band, and the spectrum analyzer showed no spurious signals at all. Not bad!

I would suggest waxing the vco area before trying to adjust deviation, as the vco tends to be just a little harmonic before you "pot" it. An easy way to melt wax is to place it in a tablespoon and heat it over an electric stove burner. Don't use gas—remember that wax burns. Be sure that the vco shield is close to the PC board or you'll have leaking hot wax all over the board. A shield of double-sided PC board above and below the vco housing also helps.

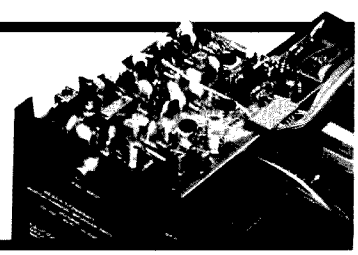
Transmitter modulation should be done last. You may find that even when you get the deviation adjusted for 5 kHz, the radio still sounds "loud." I suspect that this is because the microphone amplifier is the same as the one in the 2-meter radio, whose vco output is not doubled. There are several changes suggested in the errata sheet that will improve the loud sound and compensate somewhat for the "communications" type microphone.

Operation

Frequency selection is handled by push-button BCD switches on the front panel that are much better than the ones in the 2-meter kit. These have a very smooth feel to them and are easy to use, even in a mobile environment. Receive audio could use a little more "punch." Modifying the amplifier for a little more gain would help, as does an external speaker. Adjacent channel rejection is very good and the unit does not seem to be susceptible to intermod.

On-the-air reports of transmit audio ranged from "tinny" to "thin and hollow," although I found one guy who thought it sounded just fine. The mods in the errata sheet will help, but the big culprit is the microphone. One report said it sounded like the two-way radio in "Adam 12," and that is what is referred to as "communications quality." I suppose it's a matter of personal preference, but I like my audio to sound better than that. An old microphone from the junk box made a major improvement. My understanding is that DSE is researching other microphones to replace the one presently supplied.

Summary



This was a fun kit to build, though the experience gained in building the 2-meter kit previously was an advantage. It's not a fancy radio, but I don't need a fancy radio and a fancy price tag. Since I built it myself, I suspect that I can also fix it myself should something ever go wrong. That would be hard to say about any of the "rice rockets" that I've seen lately.

This 440 rig delivers excellent value for the price: an adequate output power level and a suitably sensitive receiver. Mobile operators may find that a little extra filtering may be in order if the power leads aren't run directly to the battery. I had problems using the cigarette lighter plug in my Buick—too much hash, especially with the air conditioning blower on. Running leads directly to the battery eliminated all but a little alternator whine, and I can live with that. I defy you to find another new, fully synthesized, UHF mobile radio for $170.■

Heath HOA-5404-1 Pan Adapter

by Marc Stern N1BLH

Heath Company Dept. 011-442
Benton Harbor MI 49022 Price class: $100

Building the Heathkit HO-5404 Station Monitor without the Pan Adapter module (HOA-5404-1) is like making toast without butter—it will work, but it just won't be right.

Imagine trying to use a monitor scope to tune in a weak CW signal near your frequency—but without a Pan Adapter. You may be able to do it by watching the trace of the pattern generated by the scope's internal sawtooth generator, or you may be able to do it with the RTTY setting. But if you do, you'll be very lucky because you still really won't have any idea where the signal is in relation to yours and you may actually tune in a different, slightly stronger signal than you had wanted. The result could easily be some missed rare DX because you tuned to the wrong signal.

A Pan Adapter module would eliminate this. Because it interfaces directly with the i-f strip of your receiver or transceiver, any signals within the i-f passband will be indicated on the Pan Adapter's display trace. With the Heathkit HOA-5404-1, any signals within about 100 kHz of your frequency will appear on the trace. The frequency you are on is indicated in the center of the scope's graticule, and signals below and above it are on either side.

With the Pan Adapter module installed, you would be able to match your frequency to that of the station you are attempting to contact and establish contact.

The Pan Adapter module is also invaluable in another way. Let's say someone is QRMing your signal. The Pan Adapter module would indicate where the offending station was in relation to yours, and you would then be able to turn your beam—providing you have a beam for that band—and get a heading on the offending station.

Of course, even if you didn't have a Pan Adapter module installed in your scope, you would still be able to use the scope quite handily for monitoring phone signals and RTTY and checking transmitter performance. But the Pan Adapter adds a great deal of capability.

A one-board project, the HOA-5401-1 is meant to be installed within the HO-5404 Station Monitor Scope. Provisions are made for its installation on the upper right rear of the chassis (looking at the scope from the front). The Pan Adapter interfaces with the monitor scope's circuit board through three connector pins, which bring voltage to the board.

A multi-colored, multi-conductor ribbon cable interfaces the module with the switches at the front of the scope. Be careful when you prepare the ribbon cable to cut it exactly as the instructions note. The reason precision is needed is that the cable must bend at a 90-degree angle so that it can fit into the edge connector. If the cable isn't cut correctly, it won't seat correctly with the edge connector pins on the circuit board.

As you would expect with Heathkit products, there's very little left to the imagination. Everything is arranged logically and the instructions follow suit.

Like nearly every modern Heathkit, the transistors, capacitors, integrated circuits, resistors, chokes, and anything else needed are arranged logically in the box. Parts are stored

in separate modules until you reach that particular step.

Even with this type of organization, working slowly will ensure that the kit will go together and work correctly on the first try. But if it doesn't, you can easily work back to the point where you made your mistake by simply retracing your steps.

For example, I found that after I'd assembled the project it wouldn't fire correctly. As I went through the troubleshooting routines, I found one of the key transistors wasn't working—no voltage—and I substituted my own for it. This cured one problem and I thought I was on my way, but the adapter hid a second, much more frustrating problem that resulted in several long-distance calls to customer assistance. In fact, the Pan Adapter ended up back in Benton Harbor. The reason it did will become apparent shortly.

As you work with the oscillator section of the board, you soon realize that the key circuit is the one containing transistor Q310. It is the crystal oscillator circuit, which operates at a frequency of 3.395 or 8.830 MHz. These frequencies cover many of the major rigs on the market. This circuit places the Pan Adapter's pip on the screen at the tuned frequency and tells you where your rig is tuned in relation to others.

As you're building this section, you run into a couple of capacitor insertions that look puzzling. Instead of two holes, there are three and you are instructed "to use the holes that best fit the capacitor supplied with your kit." Evidentally, this instruction is incorrect because I couldn't get the oscillator section to oscillate, although I used the capacitor supplied and used the "holes that best fit."

So, after about a week of troubleshooting, I sent the kit back to Benton Harbor. On its return, the technician who worked on it informed me my choice of capacitor holes was incorrect. Since this is the case, I would urge Heathkit to correct the documentation and instructions.

Another troubling error occurred in the information sheet describing the intermediate frequencies of various transceivers. As you look at the listing for Kenwood—the Pan Adapter was set up to work with a Kenwood TS-520SE—you notice something interesting: Just about all the i-f frequencies are listed as 8.830, except the 520. And, as most people know, the 520 was a less expensive version of the 820 and one would wonder why essentially the same rigs would have two differing i-f's. It doesn't make much sense, does it?

I thought so, too, and I explored the schematic thoroughly and came up with the conclusion that the Heath information sheet was wrong. I'm happy I took the time to do the detective work beforehand; with the amount of componentry on the printed circuit board, it would have been a job to desolder the components needed for the 3.395-MHz i-f and insert the new components.

In more than five years of having built various Heathkits, I haven't run across such a glaring error before, and I would urge Heath to check documentation more closely before it gets a final approval.

And, speaking of the documentation, it took me more than an hour to make all the changes needed to update the manual to reflect new components. It probably would have been easier for Heath to rewrite the brief manual, rather than rely on the buyer to do it.

That buyer had better be an intermediate level kit builder because the Pan Adapter is definitely not a kit for beginners. You have to build the Monitor Scope first and make sure it is aligned before building the Pan Adapter. But, like all Heathkits, the builder is led step by step through the building process with explicit detail.

In operation, the scope and the module work very well together. I was able to find signals and move over to them very easily. It also helped me find a clear frequency quite easily, which isn't easy on 20 meters these days.

It is actually simple to use and merely takes pressing three buttons—two at the same time—on the front of the scope to fire up the Pan Adapter. Simply pushing SSB, RTTY, and 100 kHz swings the Pan Adapter into action. There's a marker pip that indicates where you are in relation to the other stations in the passband of your radio.

Be aware, though, that you have to connect the module to the i-f of your transceiver or receiver. It's easy to do and Heath supplies the decoupling capacitors and instructions on how to do it. They also supply the miniature RG-174 coax to make the connection.

In the final analysis, the Heathkit Pan Adapter module is a worthy addition to the HO-5404 Monitor Scope. In fact, I think it should be included as part of the whole kit, rather than being an extra cost option at $99.95. Without it, the kit is like dry toast. It's filling, but isn't nearly as good.

Just the FAX, Ma'am

Answer ham radio's most popular question in agonizing detail with this complete one-chip weather facsimile system for your Commodore 64. Next month: Using your C-64 to control the weather!

My article "One-Chip Facsimile" (December, 1985) has kept a good number of Atari owners glued to their terminals, watching the weather. It soon became apparent that Commodore 64 owners were feeling a bit miffed at being left out of the fun. I bought a C-64 and modified the program to work with the new system; the result is this article.

What It Can And Cannot Do

This system will receive facsimile signals and display the received charts on the computer's monitor or TV screen in a space roughly two displays wide and three displays long. A joystick is used to scroll the screen around the chart. The received charts may be saved on disk or printed.

The system will properly display facsimile signals sent at a rate of 120 or 60 lines per minute (lpm). These rates (particularly 120 lpm) are used by most commonly heard stations.

Number 1 on your Feedback card

The computer samples each received line 480 times, and can display 512 lines horizontally. While this resolution can give good results, it is less than 50% of the resolution transmitted and gray tones are not used. Thus this system is more suitable for high-contrast, large-format weather charts than for satellite pictures and similar charts with much fine detail.

Figs. 2 through 4 are samples of charts that I have received at my location, and are representative of the system's capabilities.

System Components

The components of this system are: a good quality communications receiver with SSB capability, a simple tone-detector circuit, a Commodore 64 computer system, and a pair of computer programs, named Visifax and Utility.

Receiver Requirements

The receiver that you use should be a stable, good quality, general-coverage receiver with SSB capability. If your receiver provides acceptable ease of tuning and frequency stability for SSB voice signals, it should be usable for facsimile reception. I have used a Yaesu FRG-7 and a Sony ICF6500W with good results.

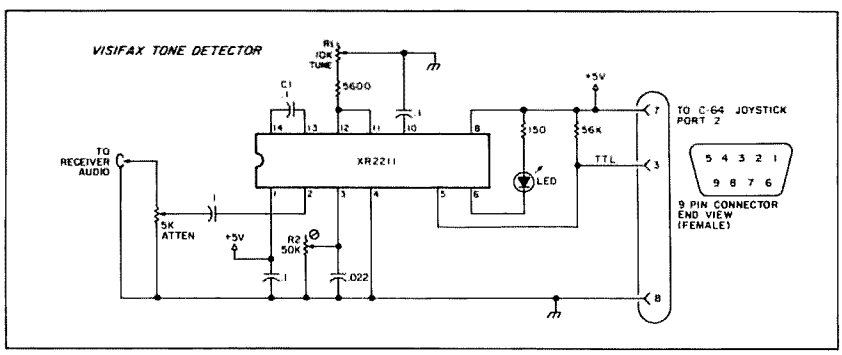

Fig. 1. Tone-detector schematic—one chip is all you need to display weather facsimile on your C-64.

The Tone Detector

The tone detector is a simple circuit that connects between the receiver audio output and joystick port 2 of the computer. The detector converts the facsimile tones to TTL pulses that the computer can use. The circuit, shown in Fig. 1, is based on the XR-2211 tone detector. R1 and C1 determine the detector's frequency, and R2 is used to adjust for the sharpest detail as a chart is being received. The LED serves as a simple but effective tuning indicator. The 5-V power source is supplied by the computer.

Most parts may be obtained from local outlets. The XR-2211 IC may be obtained from several mail-order parts suppliers (Jameco, Digi-Key, JDR Microdevices, etc.). The construction methods used are not critical.

The Computer System

The Commodore 64 computer and the two programs are the heart of the system and control all aspects of reading and displaying facsimile charts. This system is not usable on the VIC-20 computer because of memory requirements and other computer differences. A disk is required for program loading and (optionally) to hold received charts. An optional graphics dot-matrix printer may be used to produce a hard copy of the received chart; one was used to produce Figs. 2–4.

The Visifax Program

The Visifax program reads the tone detector's output signal at joystick port 2 and displays the received chart on the computer's monitor. Various options are available for the user to control the receiving process. The program is written entirely in assembly language; it is not shown here because of its length (about 25 pages). It is a complex program that uses several of the Commodore 64's sophisticated capabilities to do the job at hand.

The Visifax display consists of two lines of titles at the top and two lines at the bottom to enter controlling commands. The third line from the bottom contains one of two messages to aid in the command selection. The middle portion of the display consists of the received chart.

Because the C-64 uses the same circuitry to read the joystick ports as is used to scan the keyboard, it is difficult to use the joystick ports and keyboard simultaneously. Thus a standard joystick plugged into joystick port 1 is used to totally control the Visifax program once it is running. Upon ending Visifax, it is important to unplug the tone detector and joystick before attempting to use the keyboard. Failure to do so could result in a partial system lockup, but it will not damage the computer in any way. Should this occur, reset the computer by pressing and holding the RUN/STOP key and then striking the RESTORE key. The display will clear but memory will not be disturbed, and you may then key in whatever you desire.

Visifax Commands

The two bottom lines of the Visifax display contain eight commands. The one that you may direct the computer to respond to next is highlighted in green (gray with a monochrome monitor). Moving the joystick will allow any of the commands to be highlighted. Pressing the joystick's FIRE button will cause the highlighted command to be performed.

RESET

This command will start the process of displaying a chart. The chart is displayed as received from left to right and from bottom to top (so most charts are viewed normally...without your having to stand on your head!). The portion of the chart that is visible on the display is automatically set to the lower left corner. Subsequent RESET commands will reset the displayed chart to the left of the screen without altering the synchronization.

SYNC

Each SYNC command will have the effect of displaying subsequent received lines down the display about one half inch. This command should be used as required to center the received chart properly. Most stations precede charts with a short period of synchronizing lines that may be used for centering.

SKIP

Each SKIP command will increment the number of received lines to skip between displayed lines. This feature will allow compressing the received chart horizontally, fitting more of it onto the computer's screen. From 0 to 9 received lines may be skipped between displayed lines. I find that a skip value of 1 is used most often.

MODE

The MODE command will step through the three possible modes of operation, with the present mode shown next to the word MODE. Mode ONE indicates that the chart will be received and the process will be complete when the right-most line is displayed. Mode CONT allows the continuous display of charts, with one overlapping the last. Mode WAIT halts the display of any more received lines but does maintain synchronization. This feature may be useful to eliminate unwanted sections of a known chart.

CLEAR BUFFER

Selecting this command will simply clear the buffer that holds charts as they are being received, and thus it will clear the computer display.

SCROLL

This command is used as desired to control which portion of the received chart is being displayed. (As mentioned, the received chart is about six times the size of the display!) Selecting this command will change the message on the third-from-the-bottom display line from PRESS JOYSTICK BUTTON TO SELECT COMMAND to USE STICK TO SCROLL, BUTTON TO DISPLAY.

Now repeatedly bump the joystick in the direction of the chart that you wish to view. A pair of numbers (hexadecimal, and of the form row:column) next to the word SCROLL will indicate the portion of the chart that will be displayed. Row numbers range from 0 to 28. Column numbers range from 0 to 18. The lower left corner of the chart is at row 0,

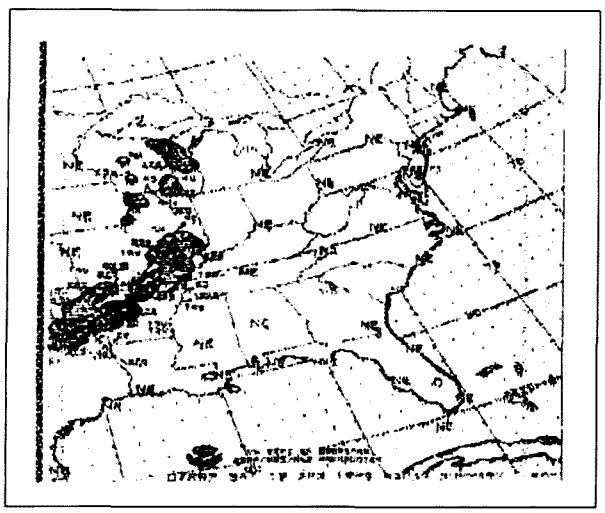

Fig. 2. A radar summary chart received from NAM on 3.357 MHz.

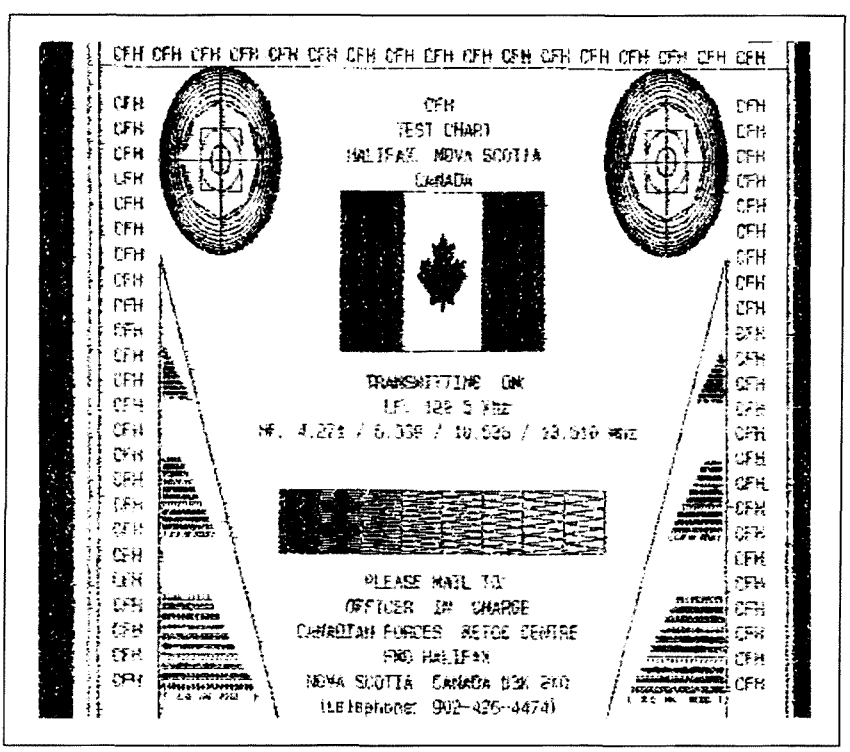

Fig. 3. This test chart was received from CFH on 6.330 MHz.

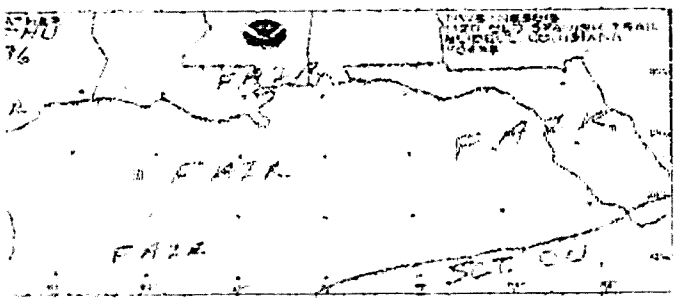

Fig. 4. A chart received from WLO on 6.852 MHz.

column 0. After obtaining the desired row and column numbers, press the joystick button to update the display to this portion of the chart. The joystick may now be used as desired to select any further command.

LPM

This command may be used to choose which basic receiving rate (in lines per minute) is to be used. Values of 120 or 60 are possible. Most commonly heard signals will utilize a rate of 120 lpm.

QUIT

This command may be selected when it is desired to leave the Visifax program and return control to Basic. Please recall the earlier note about the incompatibility of the simultaneous keyboard and joystick port usage. When you use this command, the last chart received is maintained in a buffer in memory. (It is lost if you turn off the power!) The Utility program can print it or move it to disk. *Running any program other than Utility will destroy the chart.*

The Utility Program

Utility is required to provide several auxiliary functions, including:

- Loading the Visifax program
- Making a backup copy of the Visifax program
- Starting up Visifax
- Saving a chart to disk
- Loading a chart from disk
- Printing a hard copy of a chart from memory

It is a relatively short program that is written in Basic. The user controls its operation simply by selecting an item from a menu by pressing a single key. Utility is started by keying in the following two commands: LOAD "UTILITY",8 and RUN.

Program Visifax is loaded from disk to memory automatically when Utility first begins operation. This is required because Visifax actually assists Utility in most operations.

A backup copy of the two programs should be made on a second diskette for safekeeping (format it ahead of time). With the Utility program in memory (but not running), you may make a backup copy by issuing the command: SAVE "0:UTILITY",8. To save a backup copy of Visifax, run the Utility program and simply select the SAVE VISIFAX PROGRAM menu item.

Two menu options are available to start up Visifax—with and without clearing the received chart memory buffer.

Two menu options are available for saving a chart from memory to disk and from disk to memory. An empty diskette will have room to hold the two programs and four charts, with about 100 blocks left over for whatever you like. It will require one and one half to two minutes to save or restore a chart. A chart that has been restored to memory from disk may be viewed by starting up Visifax. (Omit the buffer clear option!)

The final menu option will print a hard copy of the memory resident chart on an attached Gemini 10X dot-matrix graphics printer (via a CARDCO G-WIZ printer interface). Since Utility is written in Basic, printing a chart is not a speedy operation. It will require 15 minutes. However, since Basic is used, this portion of the program may easily be modified for usage with similar printers. The program contains enough remarks to get you started.

Using the System

Turn your computer system on and load and run the Utility program. Select menu option 5 to start Visifax.

Fire up your receiver and then connect its audio output to the tone detector's input and the tone detector's output to joystick port 2 on the computer.

Tune in a strong facsimile signal until its characteristic screech-screech sound is of a medium pitch. Then adjust the detector's TUNE control until the tuning LED blinks in time with the audio. A moderate level of receiver audio output will be required.

Use a joystick connected to joystick port 1 to select the RESET command to begin the process of displaying a chart. Use the SYNC and RESET commands as required to properly position the chart vertically on the display. Fine-tune to get the sharpest picture.

The SCROLL command may be used at all times to scroll the received chart around the display.

To save or print a received chart, unplug the tone detector first, then select the QUIT VISIFAX command. Using the keyboard, load and run the Utility program and select the SAVE A CHART TO DISK or PRINT A CHART menu item.

Getting the Programs

For a fee of $10 to cover my expenses, I will send you a diskette containing the Visifax and Utility programs, a reprint of this information, and other various notes. Be sure to request the Commodore 64 version.

If you would like to understand better how Visifax works or how to make modifications to it, I can include printed listings of the programs and the assembler source code file for an additional $5. EDITOR64 and ASSEMBLER64 were used for program development. Note that you may modify the Utility program without this option.

I cannot accept any CODs or credit cards. The package is available from me at the address given at the beginning of this article.

A tape-based version of these programs can probably be developed. Write me if you desire a tape version (but send no money). If there is sufficient interest, I will develop it and inform you of its availability. ■

WHERE TO TUNE

By far the best facsimile signals at my location are from the Naval Eastern Oceanography Center (NAM) on 3.357, 8.080, 10.865, 16.410, and 20.225 MHz. Weather charts and satellite photographs of all types are broadcast nearly continuously.

Canadian station CFH out of Halifax, Nova Scotia, on 4.271, 6.330, 10.536, and 13.520 MHz also transmits interesting weather charts. CFH usually broadcasts one or two charts for the first 15 to 30 minutes of each hour.

Coastal station WLO broadcasts on 6.852, 9.1575, and 11.145 MHz with information that covers the entire Gulf of Mexico area. The current schedule consists of various charts starting at 0250, 0850, 1440, 1800, and 2000 UTC.

Coast Guard station NMF offers a similar service on 3.242 and 7.530 MHz that covers the northeastern coastal area. Scheduled times are 0530 and 1730 UTC.

Listed frequencies for San Francisco (I have heard a few) include 4.346, 8.682, 12.730, and 17.151 MHz. Honolulu possibly uses the frequencies 4.803, 9.440, 13.863, 16.398, and 21.785 MHz. I have copied this station only briefly.

Make the Switch to PIN Diodes

Many of us have older rigs which just can't handle QSK. Here's how to replace your relays with solid-state switches.

Number 2 on your Feedback card

It's getting very difficult to find decent replacement relays for old transceivers. Who wants to pay $45 for a relay when you know that it will need to be replaced almost as soon as you put it in? Or maybe you're just tired of cleaning the silly things. This article will show you how to replace the relay in your transceiver with a faster and more reliable solid-state switch.

Believe it or not, the easiest part of this modification is antenna switching, and it doesn't matter if you put out a milliwatt or a kilowatt. On the other hand, the circuit for dc switching requires a lot of planning and thinking—but you'll find that it is worth the time and effort it takes.

Let's Switch

Fig. 1 shows the basic configuration of a typical switching circuit used in old transceivers. The basic requirements in those days were:

1. Switch B+ from receive to transmit and back.
2. Toggle the antenna from receiver to transmitter.
3. Change the speaker from an output device to an input device, or just disable the speaker.
4. Handle any additional circuit requirement like switching bias, selective signaling, accessories, etc.

Requirement number three may sound unusual to newcomers. Speakers used to be employed as dynamic microphones when the equipment was in the transmit mode, despite their bassy sound. Some cheap (and not so cheap) intercoms use a similar procedure today.

Modern relays are rated at several million operating cycles. Unfortunately, they often fail after only several thousand cycles of operation. In heavy-duty operation, such as the dispatching of taxis, the rated specification is not applicable.

The New Approach

During the late 60s and early 70s, better and more reliable power transistors were already available for use as dc switches in the 5–10-Amp environment. Most equipment was designed for 13.8 V dc, so the power was handled very easily by these devices. Yet the most economical method of VHF/UHF antenna switching in the 2–50-Watt range was still the relay. In addition, a single or twin relay was about the same size as its transistorized equivalent, so using semiconductors saved no space.

The PIN Is Here

Vacuum-tube diodes were used for many years after solid-state devices became available (my Heath SB-100 uses a tube for avc and solid-state diodes for other functions). Then the PIN diode appeared. At first, PIN diodes were used only in VHF and UHF hand-helds, state-of-the-art (expensive) equipment, and military radios. The advantages of the PIN became evident, and it quickly became a common part of all radios, regardless of power or frequency. Despite this popularity, the behavior of the PIN is still not widely known. Let's shed some light on the subject.

First, we'll look at the characteristics of the PIN diode, then we'll see how it works, and finally we'll explain how to design a practical circuit. The characteristics are:

- It does not rectify the applied signal.
- It does not generate harmonics.
- Once forward-biased, it offers a fixed resistance path (R_S).
- Its capacitance (C_T) is constant regardless of the applied bias at VHF and above frequencies.

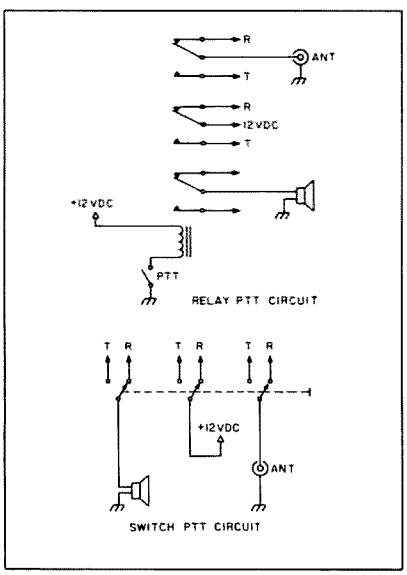

Fig. 1. This is the switching arrangement you'll find in most older transceivers.

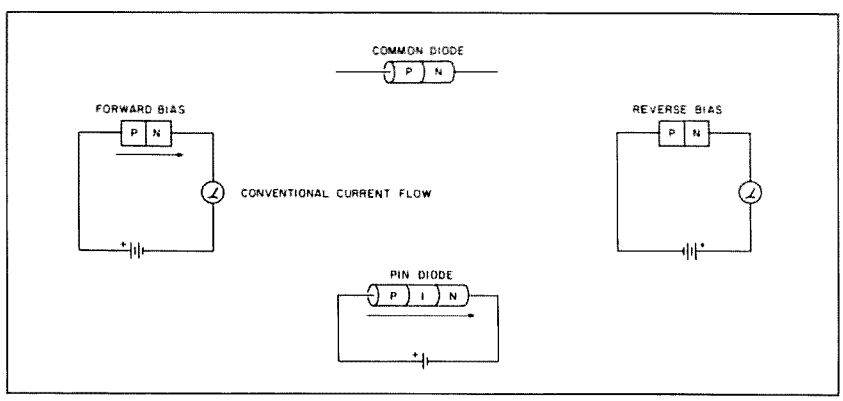

Fig. 2. The PIN diode could be called a current-controlled resistor at rf. The high-resistance intrinsic or "I" region is what sets the PIN apart from a normal silicon diode.

- It may be used from below 500 kHz up to several GHz, depending on the model.
- Its insertion loss is very low.
- It supplies a high degree of isolation.
- Its switching speed is very high.

What Is a PIN Diode?

The PIN diode is better described as a current-controlled resistor at radio and microwave frequencies. The difference between a common diode and a PIN diode is that the common diode is made of a semiconductor with P dopant in one side and N dopant in the other side (see Fig. 2). As a PN junction, the PIN is developed with the special property of easily conducting current in one direction (forward bias) while impeding current flow in the other (reverse bias). Current flows when the anode is positive and the cathode is negative. The PIN diode is made like a common diode except that a high-resistance I-region is sandwiched in between the anode and the cathode.

See Fig. 3. When the PIN diode is forward-biased, the current does not flow immediately through the I-region. It takes some time to do so. In that tiny moment, a charge is stored in the I-region, lowering its resistance to a value known as R_S. When the diode is zero-biased there is no storage charge in the I-region and the diode appears as a capacitor. This characteristic is known as C_T. The storage time is long enough so that the PIN diode cannot rectify at very high frequencies. The alternating rf current changes from plus to minus faster than the I-region allows conduction. In other words, a charged particle needs some six microseconds to travel through the I-region, which is quite a long time for any frequency period above 20 kHz.

The most common use of PIN diodes is as a switch at rf—although they are used as modulators, rf attenuators, and phase shifters up into the GHz region. Don't try to use them as detectors or to rectify an i-f signal in an agc circuit. Also, don't use them to generate harmonics from your crystal markeroscillator—it just won't work.

Switching Circuits Using PIN Diodes

There are two kinds of basic circuits using PIN diodes as switches. One is the series-connected single-pole, single-throw (SPST) switch and the other is the shunt-connected SPST switch. Both are shown in Fig. 4. The series-connected diode, when forward-biased, produces a very low insertion loss over a broad frequency range. Typically, the average insertion loss is around 0.1 dB. When

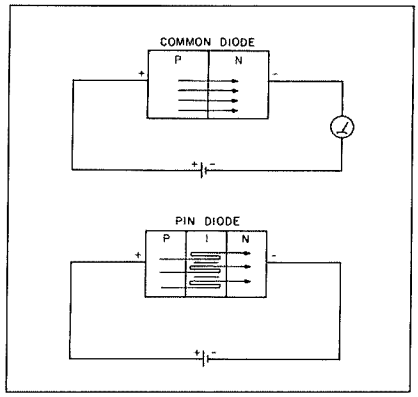

Fig. 3. The I-region is the reason a PIN diode does not rectify an rf signal.

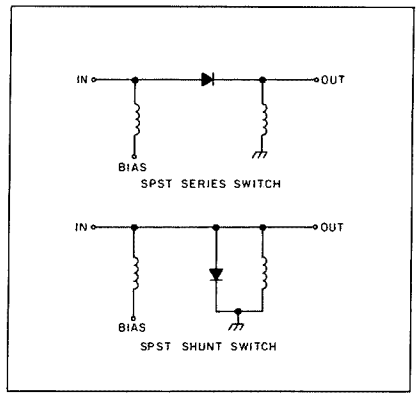

Fig. 4. These are the two basic switch configurations.

reverse-biased, the diode impedance is very high. The average isolation is 25 dB for frequencies between 10 MHz and 2 GHz, with typical values between 15 dB and 60 dB. When shunt-connected, the PIN diode has almost the same figures for insertion loss and isolation.

The insertion loss in series-connected diodes depends on the R_S value and has a linear proportional response. The higher the R_S value, the higher the insertion loss. Typical R_S values are from 0.1 Ohms to 10 Ohms. The isolation depends on the C_T value and is also related to frequency. In this case, the higher the frequency and the higher the C_T value, the lower the isolation. C_T values are on the order of 0.2 pF to 4.0 pF.

The maximum rf power (P_A) which the PIN diode switch may handle should be calculated for a case of maximum swr or a totally mismatched antenna. It is done this way because often the transmitter is operated without an antenna or with a shorted antenna connector. For a perfectly matched antenna, the power capability of the diode is increased by a factor of four. The equation used is:

$$P_A = (12.5 \times P_D)/R_S$$

where P_D is the maximum specified dissipation of the device. 12.5 is a constant for 50-Ohm impedance systems. Note from the equation that dissipation is directly proportional to P_D and inversely proportional to R_S.

Combining Series and Shunt Values

Fig. 5 shows a combination of series and shunt connections using two PIN diodes. The circuit shows a diode (D1) series-connected with the transmitter and a diode (D2) shunt-connected at the receiver antenna input. A quarter-wave line is connected between both diodes to help in receiver isolation. During transmit, D1 conducts and transfers rf power from the transmitter to the antenna. Diode D2 is also forward-biased, shorting out the receiver antenna input. The rf current in both diodes is almost equal, even though it may not be apparent. Hence, both D1 and D2 dissipate the same power.

Fig. 6(a) shows another interesting compound switch, the TEE SPST switch. When bias is positive, diodes D1 and D2 are forward-biased, and thus both conduct rf energy from input to output. Diode D3 is reverse-biased. When bias voltage is negative, both D1 and D2 are cut off and diode D3 is conducting, resulting in almost a short to ground. This way, if any rf energy goes through D1 it will be grounded by D3; D2 will improve the attenuation. With this simple arrangement you may construct a switch that will work very well even at microwave frequencies.

Fig. 6(b) shows a practical design using this kind of switch. The importance of this switching circuit is that if you use care in construction, it is easy to achieve more than 50 dB of isolation. Actually, the isolation is much more dependent upon circuit shielding between input and output than limitations imposed by the PIN diodes. This approach is often used in instruments like signal generators and communications monitors.

Designing the Solid-State Rf Relay

To illustrate how all of this information

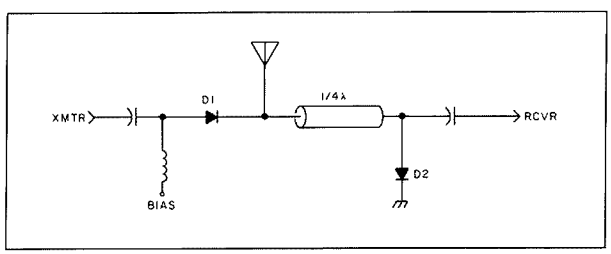

Fig. 5. The series-shunt switch offers excellent isolation.

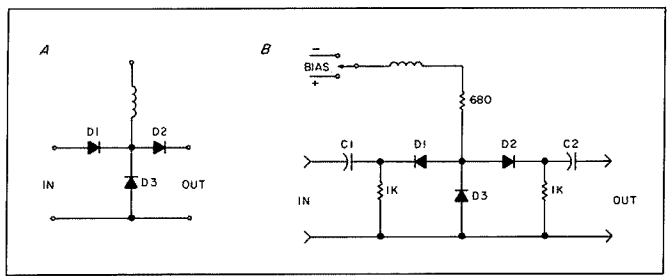

Fig. 6. (a) 50 dB of isolation is possible with the TEE SPST switch. (b) A practical design using the TEE switch.

	ECG553	ECG555	MI301	MPN3401	UM4901	UM4001	UM9401	1N5787	
P_D	0.2	0.4	0.35	0.4	37.5	2.5	1.5	0.4	Watts @25°

Note: All specs are for axial-lead packages except the UM4901, which is a stud mount.

Table I. Characteristics of several common PIN diodes.

can be put to practical use, I will design a PIN diode switch to replace the relay in the old VHF FM amateur radio, the Standard Horizon 2.

I began my design by gathering and comparing specifications. Table 1 shows the most important specs of several diodes. P_D stands for the diode's dissipation power. $V(B_R)$ is the maximum permissible voltage allowed by the device. C_T is the capacitance at the specified frequency and applied voltage. R_S is the resistance at the specified current bias and operating frequency. P_A is the maximum amount of power the diode can handle as a switch at maximum swr. From Table 1, I chose the most suitable device for the Horizon 2, using $P_A = (12.5 \times P_D)/R_S$ to determine the maximum power each device could handle.

The Horizon 2 is rated at 25 Watts output; a UM9401 is more than adequate for the job since it is capable of managing some 25 Watts at 50 mA of forward bias at a high swr.

The UM9401 is smaller than a common silicon rectifier diode, but don't judge it on its size! Despite being just 2.29mm in diameter, it can handle more than 100 Watts of rf when properly installed. The UM9415, which is 3.30mm in diameter, can carry more than 1 kW when forward-biased at 1 Ampere and properly installed.

The UM4901 is capable of handling 10 kW of rf CW power or 100 kW of peak pulse power if the antenna is perfectly matched—yet it is not larger than a 10-Watt stud-mounted zener. Several diodes are rated at 1,000 volts or higher.

The most suitable circuit for our application, which is also widely used in modern radios, is the combination of the series and shunt switch, shown in Fig. 5.

First, I replaced the quarter-wave line with an equivalent lumped circuit using components selected from the formulas in Fig. 7. The values computed for the center of the 2-meter band (146 MHz) are 0.0545 uH for L and 21.8 pF for C. Since the circuit capacitance will be part of the circuit, I chose 20 pF for C. The additional capacitance is supplied by the stray wiring capacitances and the C_T capacitance of the diode. The coil is made by winding five turns of enameled #22 wire. Some trial and error may be necessary in this regard, but the recommended values should work in any 2-meter radio.

The bias resistor is calculated using Ohm's Law (see Fig. 7). Assuming a power supply of 12.6 V dc and 50 mA of bias current, the resultant resistance value is 237 Ohms. A resistor of 220 Ohms at 1 Watt is close to the calculated value which, by the way, is not critical at all. For a radio of less power (say 10 Watts) you may use a 270-Ohm @ 1-Watt resistor and the resulting bias current (0.050 A) will be enough. All modern radios use

1987 CALLBOOKS

The "Flying Horse" sets the standards

Continuing a 66 year tradition, there are three new Callbooks for 1987.

The North American Callbook lists the calls, names, and address information for licensed amateurs in all countries from Canada to Panama including Greenland, Bermuda, and the Caribbean islands plus Hawaii and the U.S. possessions.

The international Callbook lists the amateurs in countries outside North America. Coverage includes South America, Europe, Africa, Asia, and the Pacific area.

The 1987 Callbook Supplement is a new idea in Callbook updates; it lists the activity in both the North American and International Callbooks. Published June 1, 1987, this Supplement will include all the new licenses, address changes, and call sign changes for the preceding 6 months.

Publication date for the 1987 Callbooks is December 1, 1986. See your dealer or order now directly from the publisher.

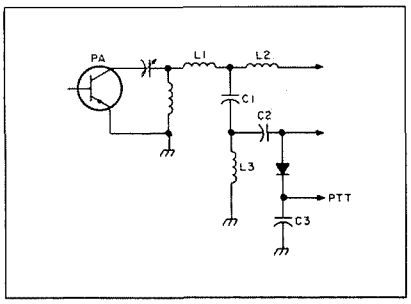

Fig. 10. Motorola used this clever circuit in their Maxar VHF radio.

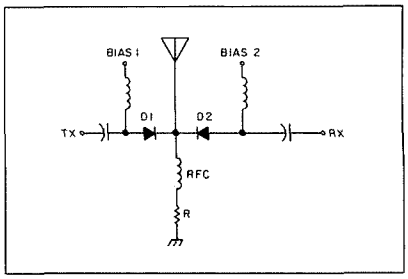

Fig. 11. PIN diodes can be used with good success at HF. . . try this circuit, taken from a Unitrode handbook.

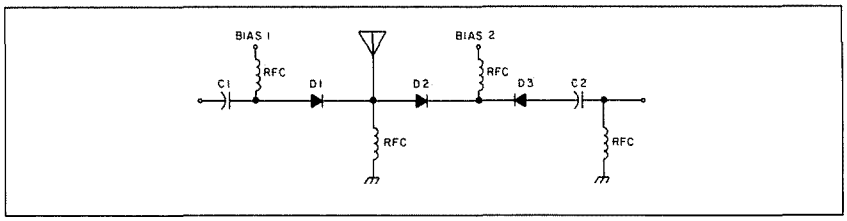

Fig. 12. This circuit will switch up to a kilowatt of rf.

standard 10% resistors installed for this purpose. Should your power be higher (say 35 Watts), use a 150-Ohm at 1-Watt resistor. Remember that the calculation is for an swr of infinity, and if the antenna is perfectly matched the allowable power is quadrupled. This means that, in a transmitter with swr protection, the PIN may be operated with a lower forward bias.

The choke is wound on a high-value half-Watt resistor—put as many turns of enameled #28 wire as you can in one layer. You should shoot for 2.7 uH for VHF or 1.2 uH for UHF.

The completed circuit is shown in Fig. 8. C1 and C6 act as blocking capacitors, while C2 decouples the diode bias line. D1 is the series switch on the transmit side, and D2 is the receiver shunt. C4, L1, and C5 form the quarter-wave section. D3 and D4 provide protection for the receiver input; they clip signals that rise above about 0.6 volts.

Sticking It In

OK, you've got everything built and tested. Where are you going to install your creation? The obvious place is in the space where the relay used to sit. If you end up putting the board in some other spot, try to situate the quarter-wave line and the receiver switch as close as possible to the receiver input circuit. If you can't do that, use coax for the interconnection.

The El-Cheapo Approach

Motorola used a very interesting circuit in their old Maxar VHF radio (Fig. 10). C1, C2, and L3 form a quarter-wave line which is grounded by PIN D1 during transmit—this places C2 at ground potential and C1 at a high impedance. During receive, D1 is cut off and the rf passes through the quarter-wave line. This approach may not work unless your PA is the same as the one shown—note that there is no pi network on the output. I couldn't use this configuration on the Standard since the low-impedance path during receive goes to the wrong place.

PIN Diodes at HF

Even though PIN diodes are essentially microwave devices, they can be used at HF with good success. Unitrode's *PIN Diode Designer's Handbook* suggests using the circuit shown in Fig. 11. This design uses two diodes and two bias voltages. Forward bias is applied to D1 or D2, depending on whether you're transmitting or receiving. The upper frequency is determined by the capacitance of D2, and the bandwidth is a function of the chokes.

Fig. 12 shows another approach to HF switching, again by Unitrode. Using the diodes shown, the circuit will safely handle up to a kilowatt of rf. D1 should be selected for its power dissipation, and D2 for its capacitance (D2 doesn't handle much rf current so you can pick a less expensive device with a lower dissipation). Again, the bandwidth is a function of the chokes.

Finally, the 1985 ARRL *Handbook* describes an outboard design based on Unitrode's UM5767. The circuit, a variation of the one shown in Fig. 8, handles 100 Watts. Transmitted rf is coupled to the antenna through a lumped quarter-wave circuit; the diodes are installed only in the receive path (which means that they need not handle much rf). This could be the perfect compromise for your old SSB transceiver, and might even be cheaper than replacing a relay.

In Closing

The modification I've described for a VHF radio is very simple, and you should have no trouble adapting it to just about any unit. If you get really stuck, send me an SAE, a handful of IRCs, and a complete description of the radio you're trying to modify. ■

Shoestring Shortwave

Turn a handful of parts and a piece of wood into a two-transistor shortwave converter.

Number 3 on your Feedback card

Here is a basic shortwave converter that uses only two low-cost transistors and two D cells for power, and is designed for low overall cost with no sacrifice of sensitivity or selectivity. The circuit converts frequencies from 6 to 21 MHz to the AM broadcast band. No wires or connections of any kind to the AM set are needed—a ferrite-core coil positioned near the loopstick of the AM set will do the trick. The AM set supplies the sensitivity, selectivity, avc, audio, and loudspeaker for good reception of shortwave stations from around the world.

The converter is wired point-to-point and thus is easily maintained, repaired, and modified. It's simple to just add on sections for different modes, such as CW, SSB, FM; for microwaves; and for special frequencies as desired. Modules plug together with phono jacks, so the radio can be reconfigured in a matter of minutes.

Front panels are of double copperclad phenolic—my long-time favorite because the thin copper solders with the touch of a small iron, and the phenolic is very strong for front panels, boxes, shield walls, sub-panels, etc. The main base is wood; each module is fastened down with one large screw for easy servicing, modifications, add-ons, and other changes you might want to make later (see Fig. 1).

Construction

The first module is the preselector, shown in Fig. 2. L1 is wound on a high-Q ferrite core, which cuts down image response and increases selectivity. The circuit is tuned to the desired frequency by C1, a 365-pF maximum capacitor. No vernier is needed, as the tuning is not that critical. The shielded output cable to the mixer module is coupled to L1 via L2 (two turns of wire around the ground end of L1).

Oscillator Circuit

The oscillator module requires more care in its construction, testing, and tuneup, but expect no trouble if you follow instructions carefully. Look at Fig. 3. L10 and C10 determine the frequency in the 6–21-MHz range. The emitter of Q1 is tapped up one turn from the ground end of L10 through C12, which produces feedback to Q1 and causes oscillation. (When measuring voltage in this circuit, always take care to differentiate between the dc and the rf voltages. The collector has the full 3 volts on it from the battery supply, as well as the maximum rf voltage. The base has 1.2 volts dc on it when operating but is grounded for rf by C11; thus it has no rf voltage on it, measured to ground. The emitter has 1 volt dc on it, measured to ground, and also a small amount of rf.)

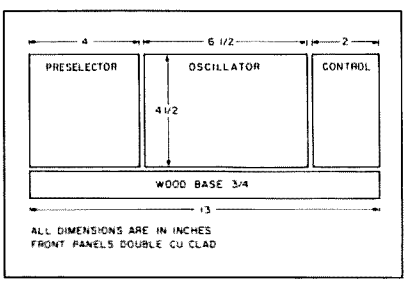

Fig. 1. Front view of the converter. Modules are mounted on a piece of 3/4" wood.

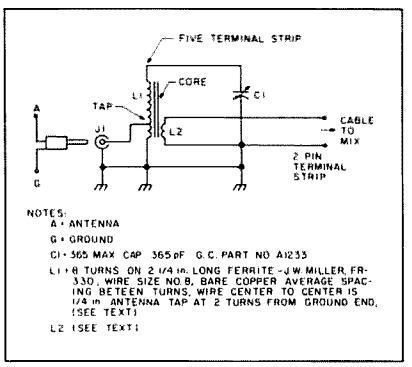

Fig. 2. Preselector schematic.

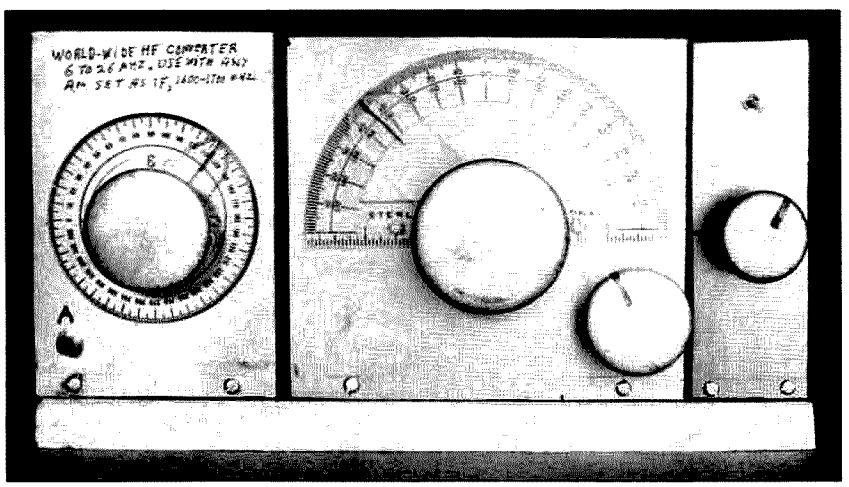

Photo A. A spruced-up front panel for the prototype converter on the cover of the magazine. Two protractors are installed for ease of logging.

The rf generated by Q1 through its feedback circuit and present on L10 is coupled to L11, a single loop, and sent via the oscillator cable (which may be twisted-pair or shielded cable—not critical) to J21 of the mixer module. The position of the emitter tap on L10 controls the amount of oscillation, and may be adjusted as follows—this *is* critical. Move the tap a little closer to ground (perhaps three-quarters of a turn from ground) to *reduce* oscillation and perhaps one and one-quarter turns *away* from ground to increase oscillation. Too much feedback will show up as a lot of loud noise when the set is operating.

L11 does not need to be over L10. Best results are had by placing L11 over the ferrite core only, spaced about one-eighth to one-quarter inch from the low-voltage end of L10. (This is the end of L10 that is bypassed to ground by C14 and also is the +3-volt connection.)

In order to place the low-frequency end of the range (6 MHz) near but not at the end of the dial, add or subtract slightly from the high end of L10. This is where the collector and C10 are connected. You will find few BC stations lower than 6 MHz.

Mixer Circuit

The circuit in Fig. 4 has been designed to offer good sensitivity, low noise, and considerable gain. The base of Q2 receives the tuned rf signal from the preselector through C22. The emitter receives the rf oscillator voltage through C21. The dc voltage on the mixer base is +.6 to +.8 volts, and on the emitter it is +.4 volts. The collector has the full battery supply of 3 volts on it. There are no tuned circuits in the mixer module itself, but the collector output is tuned in the control module by C31 and the mixer output coil, L40, which couples the mixer to the AM set.

A small copperclad wall is used to shield the input circuit of the mixer from the output. This is not critical as the frequencies are different, being separated by 1,600 kHz.

Control Module

The output from the mixer goes over a low-capacity cable to the control module where C31 tunes the mixer collector output, the cable, and the AM pickup coil to the frequency to which the AM set is tuned (see Fig. 5). The control module also contains the on/off switch for the 3-volt battery supply to the oscillator and mixer transistors, Q1 and Q2. The AM output coil, L40 (see Fig. 6), is tuned by C31 to an i-f of around 1,600 kHz. There generally is a more or less quiet spot to be found there, although occasionally between 1,800 and 1,600 kHz you may hear a neighbor telephoning a friend! The mixer output is very strong, however, and will swamp out all but a very loud local signal. If you run into trouble, just bump the i-f a little.

Note that there are a number of items in this chain, each contributing to the total capacitance, so do not be surprised at the relatively small number of turns (low inductance) in output coil L40. It works!

L40 is what you use to control sensitivity and selectivity. If you're trying to pick up

KITS AVAILABLE

The shortwave converter described in this article is available as both a kit and an assembled unit. The version for sale looks a bit fancier than the one pictured on the cover (we wanted to get your attention). Send $49 for the kit or $69 for the assembled version (postpaid) to Conelec Corp., Box 538, Peterborough NH 03458, Attn: Kit Sales.

Three add-ons will be available for the shortwave converter not too long from now; they have been designed and tested and work well. They do not require any internal changes in the converter described here. They are: a bfo for reception of CW and SSB; a low-noise rf stage for improved reception and better image rejection; and a simple detector for the 5–21-MHz range that lets you check the frequency of your oscillator.

a weak station, bring L40 close to the AM set. Moving L40 away from the AM set will decrease the coupling, and give you more selectivity.

The AM Set

Nearly any AM set that has a built-in loopstick coil for its antenna will work with the shortwave converter. I have yet to see one that is in at least fair condition that does not work well as the i-f and af portion of the overall receiver. Even a ten-dollar pocket portable will do, although you probably won't like the music quality (I don't!). The AM set furnishes good sensitivity as an i-f as well as good selectivity, good agc, and, if the AM set is of good quality, fair fidelity.

Operation

The first thing to do is set up the AM radio. Turn on the AM set and tune it to a quiet spot between 1,600 and 1,700 kHz. Place the output coil of the converter (L40) near the AM set. Now switch on the converter and twiddle C31 until you hear noise in the AM radio. You shouldn't have to adjust this again.

Attach an antenna—the length could be 10

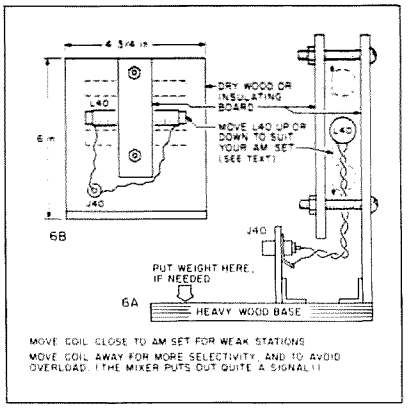

Fig. 6. (a) AM set pickup coil; (b) back view.

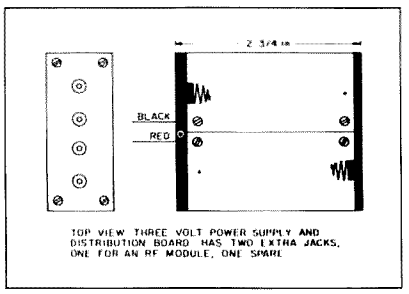

Fig. 8. Top view, 3-volt power supply and distribution board.

or 15 feet indoors, but 50 feet outdoors is better; 100 feet is fantastic! Stretch out the wire on the floor, tape or tack it near the ceiling, or tie a string to it and throw it outside over a bush or tree. Good shortwave antenna kits are also available, of course.

Tune C10 slowly, especially at the high end of the frequency range, to find the station you're looking for. If you are a bit heavy-handed, you might want to try the optional fine-tuning system shown in Fig. 7—use a giant knob to increase the bandspread even more. If you use this optional circuit, move the tap connecting C16 to L10 in order to adjust the amount of fine-tuning you want. I found that two turns from the high end of L10 suited my needs. Keep the wire of C16 no more than half an inch in length. Set C15 in the middle of its range and tune C10 to the general area you want. C15 will then tune over several stations on each side.

A good way to keep track of your activities is to use stick-on labels. When you hear a station, just fasten a sticker right to the dial. You can also use an inexpensive protractor as a logging dial—fasten it directly on the face of the converter.

One of the important features of this converter is its availability for instant use in case of emergency—so it is dry-cell battery powered. The two transistors, Q1 and Q2, use very little current: 3.5 mA total. The system is therefore quite economical. Use two heavy-duty D cells for maximum stability. At least one good portable AM set should be on hand for this emergency use. ■

THE END OF THE ROPE

Number 4 on your Feedback card

I have just given up a skill it took me years to perfect, swearing never again to help a fellow ham hang an antenna among his trees. It isn't that I don't like to be a nice guy. It's just that I can't afford being sued. Besides, my wife says she'll set fire to my shack if she catches me playing the Good Samaritan of the Skywires again.

See, I got myself in trouble the last time I did my thing, thus proving that nothing is foolproof, not even my Indiana Rope Trick.

You've probably heard of the Indian Rope Trick, where a fakir in a turban flutes a snake out of a basket, turns it into a rope, and levitates it up into the air so his stooge can climb it. Big deal. The act winds up with this rope standing there, an Indian kid atop it, of no use to anyone.

My version is infinitely superior. I levitate a rope into the top of a tall tree without a snaker or a faker, nobody has to climb it, and it supports an antenna wire up there above the housetops where it can radiate as much rf as you want to feed it.

I don't use magic, as the Indian practitioners claim to do, or mass hypnosis, as their detractors contend they actually do. My system is earthy, pragmatic, and simple, and is based solely on skill and marksmanship. I had been practicing it for years without a problem, until just a couple of months ago.

That's when the doorbell rang at my house, repeatedly, insistently, as I ran up the stairs from my basement shack to answer it. I found an agitated young man on my front stoop, jumping up and down in apparent excitement. He was wearing a T-shirt, jeans, a baseball cap, and sneakers.

"I was driving by," he said breathlessly when I opened the door. He jerked his thumb at an angle upwards, toward the trees in my backyard. "You the guy owns that antenna?"

"Yes," I said, craning my neck to see if the wire had come down. "What's wrong with it?"

"Nothin's wrong with it. That sucker's up 50, 60 feet, hangin' in them trees!"

"Closer to 70," I said, wondering if I was supposed to have a city permit for so high a wire, or maybe a red flasher light to warn airplanes away. "It's been up there more'n a year."

"But them're locust trees. Nobody can climb to the tips of locust trees."

"I know."

"You got a lot of wire up there."

"About 270 feet," I said. "It's a full-wave loop on 80 meters. So?"

"So how'd you get it up there?"

"Ropes," I said. "Four of 'em. One in each corner. It ain't quite a perfect diamond on account of the uneven tree spacing. And it ain't quite horizontal either, because the trees are different heights. But it's close. What's your name?"

"Charley," the young man said. "I know, ropes. Of course, ropes. But how'd you get them ropes up over them treetops?"

"Oh," I said, understanding. "Shot 'em up there. My name's Guy. You a ham, Charley?"

"Yeah," he said, looking disappointed. "A ham with tall trees like you got there that nobody can climb. But I've tried that shootin' system, and it don't work. The branches're too thick. The arrows get caught in 'em."

"Can't use arrows in locusts," I said. "Nor in other snaggle-branched trees, either." I stepped back out of the doorway. "Come on in. How about some coffee?"

"If not a bow and arrow, whadya use?" Charley demanded, stepping inside, "a harpoon gun?"

"A slingshot," I said, leading him into the kitchen and waving him onto a chair. "One of those commercial slingshots powered by surgical-rubber tubing on a steel fork. Cream and sugar?"

"Black," he said, watching me pour coffee into a couple of cups. "I don't think a slingshot'll work at my place. My trees're awful thick and snaggy."

"It'll work," I told him. "Guaranteed. It's all in the projectiles. I use old spark plugs. They're ideal. Good and heavy, easy to tie to, perfect shape to penetrate tree limbs and fall back through snaggy branches."

"You tie a string to the plug, then use the string to haul a rope up?"

"Not string. I use a spinning rod with an open-faced reel carrying about a 10-pound test monofilament. That weight's light enough to shoot and strong enough to pull a polypropylene cord up with. The cord then can haul a rope up. Be happy to demonstrate it for you."

"At my house?" Charley asked, apparently enthralled at the prospect.

"Where else?" I said.

"For how much?"

"For free. I only do the Indiana Rope Trick as an amateur. Drink up and I'll show you my shack."

That was on a Wednesday. I was a little bit late arriving at his place the following Saturday morning because I got lost trying to find it. He was waiting in the front yard by the curb, pacing back and forth when I drove up. He looked relieved. Beyond his house I could see a half dozen tall trees extending well above the roof line and waving in the wind.

"I thought maybe you weren't coming," he said as I climbed out of the car. "Too windy or something."

"Took a wrong turn," I said, handing him the spinning rod. "Little wind won't bother. Hang onto that for me."

He took the rod, and I followed him around the house, through a gate and into his chain-link fenced backyard. "So where do you want the skyhook ropes?"

Charley pointed to two trees in opposite corners of the yard. There was a dipole strung between them, low, maybe 25 feet off the ground.

"There and there. I want to hang a delta loop cut for 40 between those two locusts. I'll feed it from the apex at the bottom."

"So you need to tie off the top corners at

least 50 feet up," I said, eyeing the target trees. One was close to 70 feet tall, the other maybe 10 feet shorter.

"Can do?" Charley asked.

"Can do," I said. "May take a few tries, but can do."

A little crowd had gathered to watch us. There were three kids, a dog, and a mean-looking woman I took to be Charley's wife standing in the yard. He didn't introduce us.

"Watch closely," I told the audience, tying a loop in the end of the monofilament spinning line and encircling the spark plug above the threads between the gasket washer and the porcelain. "Nothing up my sleeves." I leaned the rod against the fence, unlatched the reel, centered the spark plug in the leather pouch of the slingshot, aimed just above the top of the taller tree, and fired. The projectile arched through space, trailing its almost invisible tether line, started earthward well beyond the treetop, dropping the monofilament into the highest branches. I laid down the slingshot, picked up the spinning rod, and latched the reel.

"First shot looks good," I said. "You want to go find the spark plug, unfasten it, and tie your pilot cord to the fishing line? Then I'll start reeling it in."

"Right," Charley yelled. He galloped off, disappeared behind the target tree. I began reeling gently, feeling the line slip through the branches, stopped when the weight of the spark plug tugged at the rod tip.

Suddenly there came a caterwaul from behind the target tree—shrill, loud, ear-piercing screams of a human being in physical agony.

I dropped the rod and took off for the noise on the dead run, vaguely aware that I was being followed.

I found Charley trying to shake off a squirrel that appeared to be firmly attached to his hand.

"Ayyyyyy, get it off," he was screaming, swinging his encumbered hand back and forth at arm's length and bludgeoning at it with the other hand. "Ayyyyyy, get it off!"

I made a stab at the squirrel as it swung past me on the end of Charley's arm like the knob on the end of a pendulum, missed, tried again as it swung by on the return cycle, hit warm and yielding fur, saw the animal drop off and streak away across the grass.

My recollection of the next few seconds is blurred and comes in bursts—frozen-action scenes from a slow-motion movie, a series of time-lapse, strobe-stopped snapshots with sound. Charley, his hand spouting little geysers of blood from a dozen perforations, was prancing about under the tree, continuing to scream, waving his arm back and forth as if flagging down a train. The mean-looking woman I took to be his wife came pounding up behind me, began to beat me about the head with her fists, and joined in the screaming. The squirrel scampered up the tree trunk and disappeared into the lower branches. The spark plug I had but lately fired into space hung waist high off the ground, swinging slowly from an invisible tether.

I left it swinging and departed, hurriedly, not stopping for either my spinning rod or my slingshot, the screaming still ringing in my ears, the blows still falling about my head until I managed to outrun the mean-looking woman, maybe halfway to my car.

The blurred details of the incident later were clarified somewhat by a summons inviting me to appear in court as defendant in a civil suit seeking $5,000 for medical expenses, for pain and suffering and for loss of income sustained by the plaintiff while recuperating from multiple squirrel bites.

The bites, the complaint said, were suffered by the party of the first part when he picked up from the ground and comforted an unconscious squirrel that had fallen from a tree. The animal panicked when it recovered consciousness to find itself a captive, the complaint theorized, and ran toothily amok to bite repeatedly the hand that fondled it.

"Ayyyyyy, get it off," he was screaming, swinging his encumbered hand back and forth at arm's length and bludgeoning at it with the other hand. "Ayyyyyy, get it off!"

The hapless beast was blameless, the complaint further alleged, an innocent third party that had been minding its own business in its own nest atop a tree owned and controlled by the party of the first part, the plaintiff-victim, when the defendant-villain, party of the second part, precipitated the unfortunate incident by shooting the defenseless creature out of its home with a steel and porcelain projectile fired from a hunting-type slingshot, causing it to fall to the ground below. It was the impact of the projectile against the squirrel that produced its stunned and unconscious condition, the arousal from which led to the plaintiff-victim's injuries, the complaint said, which were the final link in a chain of circumstances clearly forged by the defendant-villain, me.

The outcome could have been worse.

My lawyer settled the case out of court, happily forestalling a possible criminal prosecution for unlawful squirrel hunting in a protected area, out of season and without a license. My insurance agent grudgingly paid part of the medical costs. And my wife granted me reluctant permission to buy another spinning rod—if and when I can afford one—after ordering me, on pain of setting fire to my shack, never ever to practice again my Indiana Rope Trick.

I promised not to, of course, considering this to be a great, though necessary, sacrifice. It is, after all, the one thing I do really well.

But would you believe I already have had that promise put to the test?

Yesterday the doorbell rang at my house, repeatedly, insistently, as I ran up the steps from my basement shack to answer it. I found an agitated young man on my front stoop, jumping up and down in apparent excitement.

"Those are locust trees," he said breathlessly, jerking his thumb at an angle upwards towards the antenna in my backyard. "You got an antenna hangin' from 'em up there 50, 60, maybe 70 feet high. How'd you do that?"

"It was easy," I told him. "I put ropes in their tops when they were saplings. Then I waited for them to grow."

He stared at me in silence for a long time. Then he left, and sadly I watched him go. ■

A Simple Way to Measure SSB PEP

Just stick out your tongue and say "ahhhhhhh."

Number 5 on your Feedback card

In the "good old days," compliance with the FCC's power regulations required nothing more than measuring dc power input to the final stage under steady-state conditions. All you had to do was multiply plate voltage times plate current on the final tube(s) or transistor(s). A kilowatt was a kilowatt: 2000 volts times 500 mA = 1000 Watts. That's a kilowatt, and that was the legal limit.

Then, single-sideband suppressed carrier came along and knocked ordinary power-measurement practices into a cocked hat. How do you measure dc power input with a plate ammeter that jumps all over? Even the ARRL didn't know—and apparently still doesn't. Nonetheless, there was and is a way. And it doesn't require the use of a calibrated oscilloscope, LEDs, so-called PEP wattmeters, or magic. Mind you, we now have to be concerned only with *output* power, not dc input power.

The FCC has defined peak envelope power (output) as "the average power during one radio frequency cycle at the crest of the modulation envelope, taken under normal operating conditions." I'm not really sure why the FCC included the word "average" in the definition when speaking of peak, or crest, but I think I know what they mean: the *maximum* power coming out of the transmitter or final amplifier.

Let's look at the simplest example, a maximum legal limit CW (A1) grounded-grid linear amplifier. We will use existing equipment found in most ham shacks. The FCC says we are limited to 1500 Watts PEP (output). All we have to do is tweak, peak, and load until the in-line wattmeter shows 1500 Watts of rf. That is 1500 Watts PEP (output) and presently the maximum we are allowed. Wasn't that simple? We didn't have to make plate-voltage times plate-current calculations, and we didn't have to apply any "fudge factors" to the wattmeter indication. We didn't even have to include the rf drive power from the exciter.

It isn't quite as simple to calculate the A3J (SSB) PEP output measurement, but it's not very hard to do, and you can do it with the same average-reading wattmeter that you already have—the Heath HM-102, Drake W-4, or the like. But we will have to take into consideration certain dc-power input parameters, plate voltage, and plate current.

The example given here presumes that the final amplifier has been properly loaded into a nonreactive load, be it dummy load or antenna, or through an antenna coupler (transmatch, matchbox, L-network, etc.). The use of a suitable monitor scope, such as the Heath SB-610, SB-614, or the like, is indispensible for proper loading of a kW amplifier. See "Tweaking Your Linear," *73*, October, 1978.

Let's say that our amplifier is the venerable Heath SB-220 (two 3-500Zs), and we have adequate drive power to run it up to about 1500 Watts output on CW. That will take an exciter capable of from 135 to 150 Watts output on CW. After tweaking, peaking, and loading—really trying hard!—the wattmeter shows only 1200 Watts. At the same time, the plate-voltage meter indicates 2500 volts and the plate ammeter shows 800 mA. This is typical. Amplifier efficiency seems to be 60% (1200 Watts out divided by 2000 Watts in = 60%) in a fully loaded condition, and that is reasonable.

Would you believe that these conditions also will produce the 1500 Watts PEP (output) that we are looking for? They will, and I will tell you why.

Under the full load of 800 mA, plate voltage was 2500. With no load plate, voltage was about 3000—not perfect regulation but what you'll find in most cases. Switch the exciter to SSB operation and set the mike gain to show desired ALC indication while saying "ahhhhhhh" into the mike.

Take a deep breath and say "ahhhhhhh" again, but this time notice and record the plate-voltage indication. Is it 2800 volts? Let's say that it is. The current drain on the power supply has pulled the plate voltage down from 3000 to 2800, and the lighter duty cycle of your "ahhhhhhh" (compared with the constant duty cycle of your carrier) has

THE RIGHT WAY TO GET EXCITED

Correct adjustment of the exciter is very important. It seems that many ops are confused by the "Mic/CW" or "Carrier Level" controls on their rigs. They are under the misapprehension that the CW-level pot also controls the output level of an SSB signal. On *some* solid-state rigs, it will; on most, it won't. Usually, therefore, during SSB operation, the CW or carrier-level control is inoperative and has absolutely no effect on SSB output power.

Whether or not it does can easily be established (without even reading the manual). Tune up the rig as usual. Note CW/Tune output power with the CW carrier-level control full up, fully clockwise. Let's say it is 100 Watts. Without changing any adjustments, switch to SSB operation and whistle into the mike a clear, steady tone. Sustain the whistle and adjust the CW carrier-level control. If there is no change in output power, the control is inoperative on SSB.

If the carrier-level function is controlled by the same knob as used for microphone level, use the whistle test and note output power at the point where the ALC meter or indicator begins to show ALC activity. The power level indicated on the wattmeter is approximately the actual output power of the exciter under SSB conditions.

allowed it to be somewhat higher than 2500—12% higher. *This is the key factor in determining PEP under voice conditions!*

Ohm's Law (I = E/R) prevails. An increase in E (voltage) produces a corresponding increase in I (current) when R (resistance) is constant. If the high voltage increases by 12%, then plate current increases by 12%. So: 2800 x (.800 x 1.12) = 2800 x .896 = 2508.8 Watts input. We have already determined that the loaded efficiency of the amplifier is 60%, and all we have to do to find the PEP output power of our SSB modulated signal is multiply plate-input power times the efficiency factor:

2508.8	plate-input power (dc)
x .60	efficiency factor
1505.28	PEP output (rf)

regardless of what the average-reading wattmeter says! I repeat: Regardless of what the average-reading wattmeter says! With an "ahhhhhhh," the HM-102 or W-4 might indicate only 200 Watts. If it shows much more, like 400 Watts, your processor is driving the pants off the final and you're probably splattering unnecessarily. (Is there ever "necessary" splatter?) Keep the processor turned off for the test.

Oh, you're wondering what to do about the illegal 5.28 Watts? Forget it. It's only .352 percent illegal. Or, if you're conscientious, unload the *exciter* by .352 percent. The amplifier is linear, isn't it?

Good luck! ■

BNR

At Bell Northern Research, our commitment to meeting evolving communications needs extends to designing, developing and testing hardware and software for leading edge telecommunications.

If you are interested in helping to create the most advanced, most practical, most innovative telecommunication systems in the world, consider the following position:

ELECTRICAL ENGINEER

As a member of the Product Integrity group you will be supporting hardware design teams to ensure high quality standards throughout the hardware design cycle from definition stage to product delivery.

You must be committed to excellence in design quality and have at least 2-4 years experience in analog/RF design with a BS in Electrical Engineering.

Experience in one or more of the following is highly desirable.

• EMC regulation • Antenna/radio propagation theory
• High speed logic design

BNR, a subsidiary of Northern Telecom, can offer you an excellent salary, comprehensive benefits and a pleasant location in Ann Arbor, home of the University of Michigan. For prompt consideration, submit your resume today to: BNR, Human Resources/73M1086, P.O. Box D, Ann Arbor, MI 48106. An Equal Opportunity Employer.

AIRDISK

AND AIR-ROM CARTRIDGE
For both the COMMODORE 64 and VIC 20
(Soon for the new C-128)

Works with all these fine terminal units to bring you the ultimate in RTTY/CW/AMTOR performance. New AMTOR+ program with variable PTT delay for slower rigs and high rate bit sync to compensate for computer clock crystal variations. It's the best $39.95 you'll ever spend to improve your station. Don't have a disk drive, then use the ROM cartridge at $59.95. On performance and features vs. cost, nothing even comes close! No complicated menus to bog you down. No limited performance programs here. The AIRDISK will enhance **any** demodulator. Disk works with both computers. Specify which for cartridge.

HERE ARE A FEW OF ITS MANY FEATURES:

• on screen tuning indicators • full or split-screen • auto-load memories* • output to commodore printers • full speed operation, morse to 99 wpm. Baudot to 132 wpm, ASCII to 300 Baud • 4 mode AMTOR • WRU • independent RX/TX normal/invert • pitch reference CW tuning • real-time disk communication* • break buffer • random code generator • RX/TX of basic programs* • 24 hr. clock • unshift or space • foxtest and more.

Microwave Building Blocks: The I-f Amplifier

Practical, versatile, and inexpensive— here's the heart of your next receiver project.

Number 6 on your Feedback card

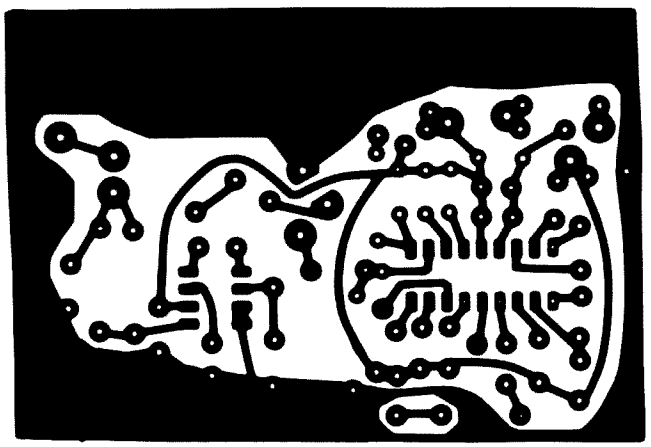

Fig. 1. Printed-circuit pattern, foil side.

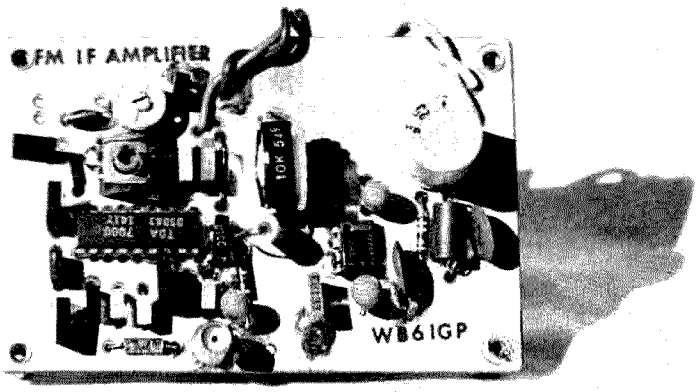

Photo A. The finished i-f amplifier. You can set the gain from 20 to 200 by simply swapping a few parts.

This versatile i-f amplifier is so easy to build and use it will amaze you. The heart of this project is the Signetics FM radio integrated circuit. Few external components are required to construct this very good quality, low-cost ($3 for the chip, in single quantities) FM radio or, in my application, an i-f strip. This is the first one-chip radio that I've made and the performance has astonished me. I've opened up many of the small imported radios and thought of converting them for monitor use on different frequencies, but the modifications proved to be futile, took too much effort, and expended a lot of time.

What I was looking for was an FM amplifier strip that was small enough to be mounted inside several different kinds of test equipment or other communication devices such as Gunnplexers, spectrum analyzers being used as system monitors, and 30- and 70-MHz test-bench i-f amplifiers. The primary use I have in mind is an FM i-f amplifier for use with a 10-GHz transceiver that I am building. The plan is to set the amplifier up on 30 MHz and enclose it within the transceiver's case—instead of using an old FM car radio. Besides, the current drain reduction and the size and weight make this package very attractive for portable work.

The good old FM car radio worked well as long as you stayed close to its original frequency range. Pulling them down to 70 MHz worked OK, but having a stereo receiver tied to the side of my microwave receiver just looked a little tacky, and it was bulky. Something smaller was required, and this chip from Signetics proved more than satisfactory.

PC Design

After I obtained the parts, I started to lay out a test circuit. It worked so well that I constructed a printed circuit board—I realized that I would be building several of these circuits for receivers and other pieces of test equipment. There are many applications for this i-f amplifier due to the ease with which

it can be moved from one frequency to another. The maximum frequency that the chip will perform at is about 115 MHz. Sensitivity is 3 microvolts for a detectable signal with slight noise, and about 5 microvolts for full quieting.

The Chip

The chip requires 5 volts and draws about 8 mA. The only function that needs alignment is the resonant circuit for the oscillator (a parallel coil and capacitor). All other functions are taken care of on board the chip. The internal i-f amplifier runs at 70 kHz and is a frequency-locked loop. Sensitivity is obtained by the use of active RC filters. I was very surprised to find that Signetics had packed so many functions onto one relatively small chip! They include an rf input stage, mixer, local oscillator, i-f amplifier/limiter, phase demodulator, and a mute detector.

Construction

I started the printed-circuit layout with two-to-one templates using the circuit suggested by Signetics. These templates have almost all of the commonly used components at double their normal size. This drawing aid makes laying out a printed circuit board very easy: I can shift components around with my eraser until I obtain the final design. The templates come in standard size (1:1) and double size (2:1) and are called PC Designer PC-1 (1:1) and PC-2 (2:1). They are made by the Tangent Template Company and are available through many of the electronic parts suppliers that advertise in *73*. (See Fig. 1 for the PC-board artwork).

I added a small low-power audio amplifier to the i-f amplifier so that the total current drain would be minimal. I chose the LM-386 because of its low battery drain and high gain. Again, the audio chip was designed to hold the number of external components to a minimum. This audio chip will complement the amplifier quite nicely. The audio level will not drive you out of the living room, but with 400 mW the audio level should be about right for most applications.

I could have used fewer components on the audio amplifier, but wishing to lay the board out only one time, I provided for all bypass and gain options (Photo A). This only adds three components to the basic design but I feel it's worth it. If you need to modify this circuit for other applications, the layout is there. The capacitor on pin 7 (10 uF) is used on higher-gain operation; the resistor and capacitor combination between pins 1 and 8 establishes the higher gain ratio. By leaving the pins open, the amplifier will provide a fixed gain of about 20. By adding these extra components, gain can be increased to 200. I have set the gain to 50 with the 1.27k resistor and the 10-uF capacitor.

Preparation

I prepared the printed circuit board (Fig. 1) by taking a small drill (about 30 mils) and drilling out all holes except those that require grounding. (A good place to obtain very small bits is a model train store that specializes in construction of HO-gauge models.) Then take a larger drill, say 3/16 or so, and on the ground side of the board ream out the copper away from each hole. When the components and ICs are installed they will not touch any ground foil on top of the PC board. After the holes have been reamed out, drill the remaining ground holes and do *not* ream them. Component leads passing through the unreamed holes will be soldered to both sides of the printed circuit board, making for a very short ground.

The circuit might look a little unusual with most of the capacitors referenced to the dc bus; this is proper with this circuit. See the parts placement diagram (Fig. 2) and the system schematic (Fig. 3). Trying to refrain from using jumpers and very thin lines on the PC board, I had quite a time trying to figure out how to run a ground lead through the dc bus. I forgot about the upper ground surface—it was a natural. Grounding pin 3 of the i-f amp to the upper ground foil provided a very good shield and the shortest possible ground leads. When circuits are operating at frequencies such as this, the very short grounds are very desirable from a stability standpoint.

Local Oscillator

The local-oscillator coil circuit is the only part of the design that needed some tinkering with to make it work. I used a 1/8"-diameter coil form wound with 5 turns of #26 wire. With a 37-pF capacitor in parallel I was able to grid dip the circuit at about 50 MHz. The coil form had a shield, and when I placed the shield over the coil and soldered the case to

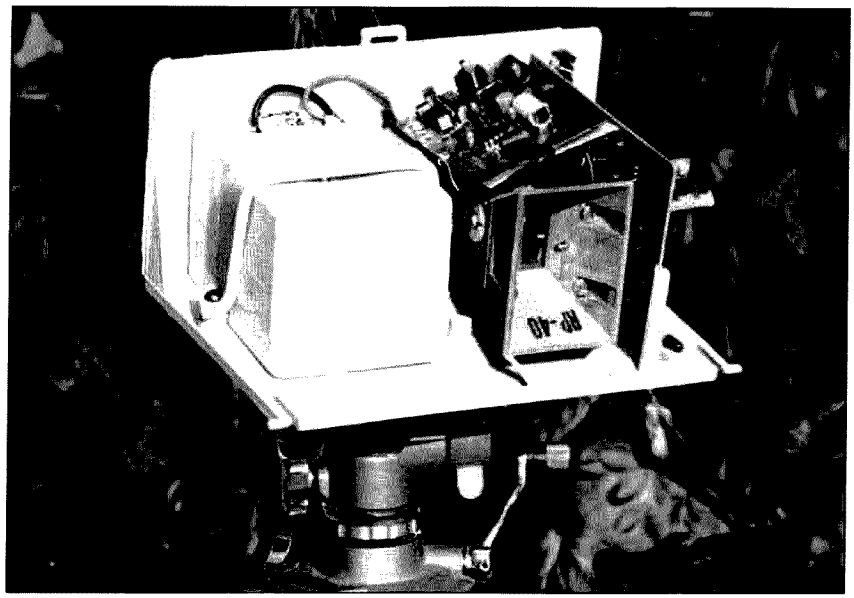

Photo B. The 10.250-GHz intrusion alarm used for a QSO with N6IZW. The i-f amp is on top of the stack.

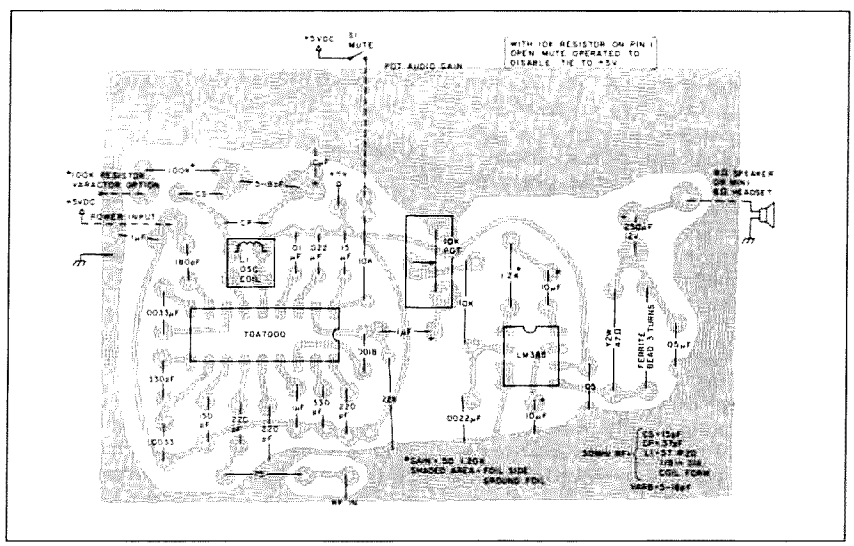

Fig. 2. Parts placement.

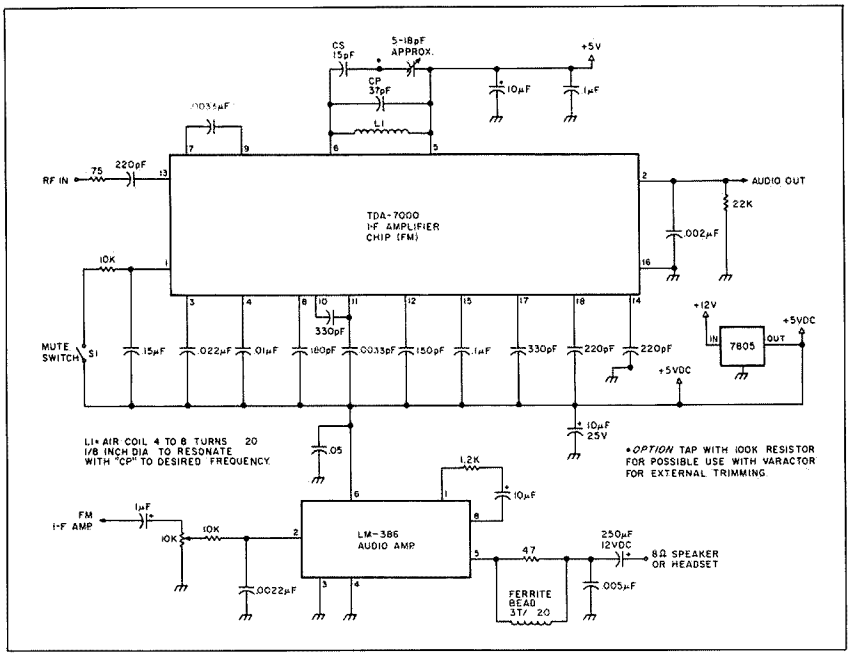

Fig. 3. Schematic diagram for the i-f amplifier.

the ground foil, it raised my previously adjusted frequency some 25%. The sensitivity was just as good as before and nothing was altered except the oscillator frequency. See Fig. 4 for oscillator-coil/capacitor details.

I provided for another set of capacitors—15 pF and a variable 2–18 pF—in series with each other across the coil for those who don't have an adjustable 1/8" coil form. Just use an air-wound coil and it will work very well. If you do not have access to a grid-dip meter, 4–5 turns on any small coil with a 37-pF or so capacitor will bring the i-f oscillator to operation in the 50-MHz range. You can trim to your desired frequency by spreading the coil or using the adjustable capacitor. I used the small coil because it looked right, and I placed the other components on the board to allow universal adaptability out of your junk box for several oscillator configurations.

Checkout

Check the PC board for possible shorts and *only then* apply power to the system. Remember that the chip operates on a minimum of 2.7 volts and a maximum of 10 volts. Do not use this chip on a 12-volt supply without a voltage-dropping network (see Fig. 3). I provided for a +5-volt regulator to reduce the 12-volt system power supply to the required potential for the i-f amplifier.

I could not detect the oscillator output frequency with my grid-dip oscillator when the chip was operating. To get around this, I injected a calibrated signal into the rf port. By observing at what frequency the chip locks you can set the oscillator to obtain the proper frequency by adjusting the coil-capacitor combination. Setting the oscillator coil and capacitor is the only adjustment that is needed. Lock-in range is aproximately 300 kHz.

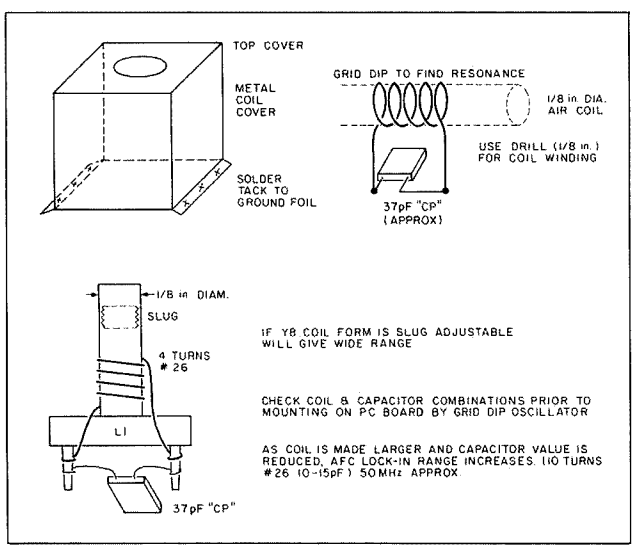

Fig. 4. Some suggestions for winding the local-oscillator coil.

Applications

My first unit was installed on a 10-GHz transceiver (Photo B). The unit was not the familiar Gunnplexer, but rather a modified intrusion alarm detector (a Gunnplexer by another name). The alarm portion was defeated and disconnected and the detector output was modified to accept the i-f amplifier. The detector-output impedance is about 200 Ohms and the input of the amplifier is 75 Ohms. I've got to thank Kerry Banke N6IZW for all of his work on adapting the Gunnplexer, and so many other parts of this project, to the i-f amplifier. Without his help this project wouldn't have gotten off the ground.

We contemplated using a small matching pi network to resonate the input at 30 MHz to improve the match and prevent operation on another frequency (such as 60 MHz). We have not tried this out yet, but field trials will show whether it is needed. We think it might be possible for the frequency-locked loop to sense 60 MHz on a working 30-MHz amplifier, but this would only happen if our frequency, 10 GHz, was not properly set.

I also plan to install one of these boards in my spectrum analyzer, tapping off the existing i-f amplifier. Trial usage showed that operation was quite good. Due to the high sensitivity of the Signetics chip, a 1"-long piece of wire provided the needed coupling to give proper input. Now when I zero a pip on the oscilloscope I can also hear the modulation and be able to identify the signals a lot easier.

By using the amplifier on the workbench, alignment of converters and preamplifiers has been made easy. No longer do I have to disable and move the station receiver to the workbench to make repairs or modifications. I can leave the station connected and even use it on a break from a long building binge. You could even move the oscillator coil up to the commercial FM band and create a garage radio of excellent quality; although it's mono, the quality of audio is very good.

6 Meters

The neatest trick was the construction of a 6-meter monitor for the station. By connecting an external crystal-controlled oscillator to pin 6, I set the oscillator to receive 52.525 MHz. Now, with 3-uV sensitivity, six-meter signals blew the doors off of the receiver. I may construct several more for 2 meters or higher frequencies by placing converters in front of the i-f amplifier. With operation causing such a low current drain on the station's emergency battery pack, several units can be operated and not even dent existing battery operation. However, with the normal station transceivers and synthesizers running, the battery runs down.

I hope I have given you experimenters several good ideas on how to use the Signetics i-f amplifier chip, the TDA-7000. I have had lots of fun and plan to use it in even more applications. I would be happy to correspond with others interested in this project and other items related to microwave applications and test equipment.

A printed circuit board etched and ready for drilling is available from the author for those not desiring to construct one from the artwork provided in this article. The cost is $5 plus postage. ■

The DXer's SCF

Build the ultimate station accessory: a switched capacitor filter for CW and SSB.

Number 7 on your Feedback card

Simple low-pass or high-pass audio filtering has never seemed to be adequate to cope with the noise encountered on the ham bands. While looking through the 1982 *Radio Amateur's Handbook* published by the ARRL, I found information on voice formants and decided to build a crystal-controlled audio Switched Capacitor Filter (SCF) to take advantage of the noise-bandwidth reduction offered by that technique.

Formants are the groups of audio frequency energy that convey spoken intelligence. The voiceprints of courtroom fame are spectrograms of formants. The first formant extends from approximately 300 to 700 Hz, while the second and third span from 1,500 to 2,700 Hz.

The filter's SSB gain from input to output is unity, to allow switching between its output and your receiver's output without volume changes. The filter's response curve is shown in Fig. 1. The 3-dB bandwidth of this unit is 1,680 Hz for SSB mode in two-band segments between 300 and 3,000 Hz, with a bandpass filter (BPF) for the first formant and another BPF for the other two. In CW mode, bandwidths of 300 or 440 Hz can be selected by a front-panel switch.

In my shack, the audio from my Kenwood TS-830 loops through the input of this filter and then connects to the "A" input of my SP-230 external speaker. The output of the filter is connected to the "B" input of the SP-230, which has a front-panel A/B-selecting switch.

Circuit Operation

The SSB BPF sections are formed by cascading high-pass filters (HPF) and low-pass filters (LPF) to produce a BPF response. The particular switched capacitor filter chips used in this project are National Semiconductor MF10s. The MF10 has LPF, BPF, and HPF outputs, but the BPF output has a high enough Q that it cannot produce the desired voice bandwidths. In CW mode, four MF10 BPF outputs are cascaded to produce the narrow response, with a pickoff after the second BPF for the wider response.

To improve the stopband rejection at the lower corners of the SSB BPFs, their input coupling capacitors are chosen to produce additional rolloff below their band segments. All voices vary somewhat in frequency content, and a minor change here from component tolerances does not make a serious difference in intelligibility. Other capacitors are added to the basic application circuit to provide frequency shaping of the total response.

Capacitor C1 provides high-pass filtering

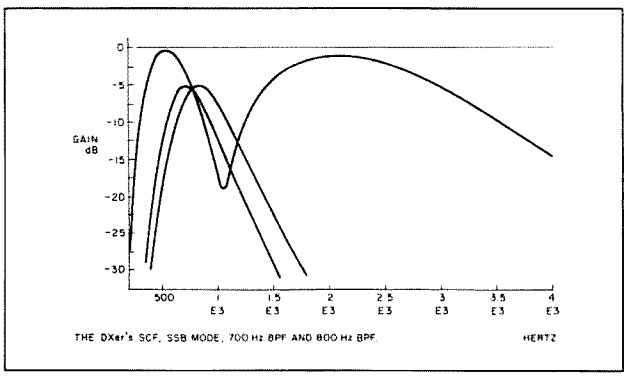

Fig. 1. The filter's response curve.

Photo B. Rear panel.

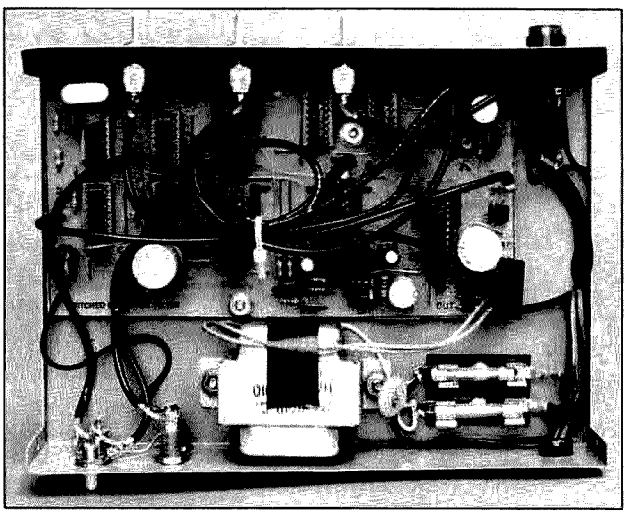

Photo C. Interior.

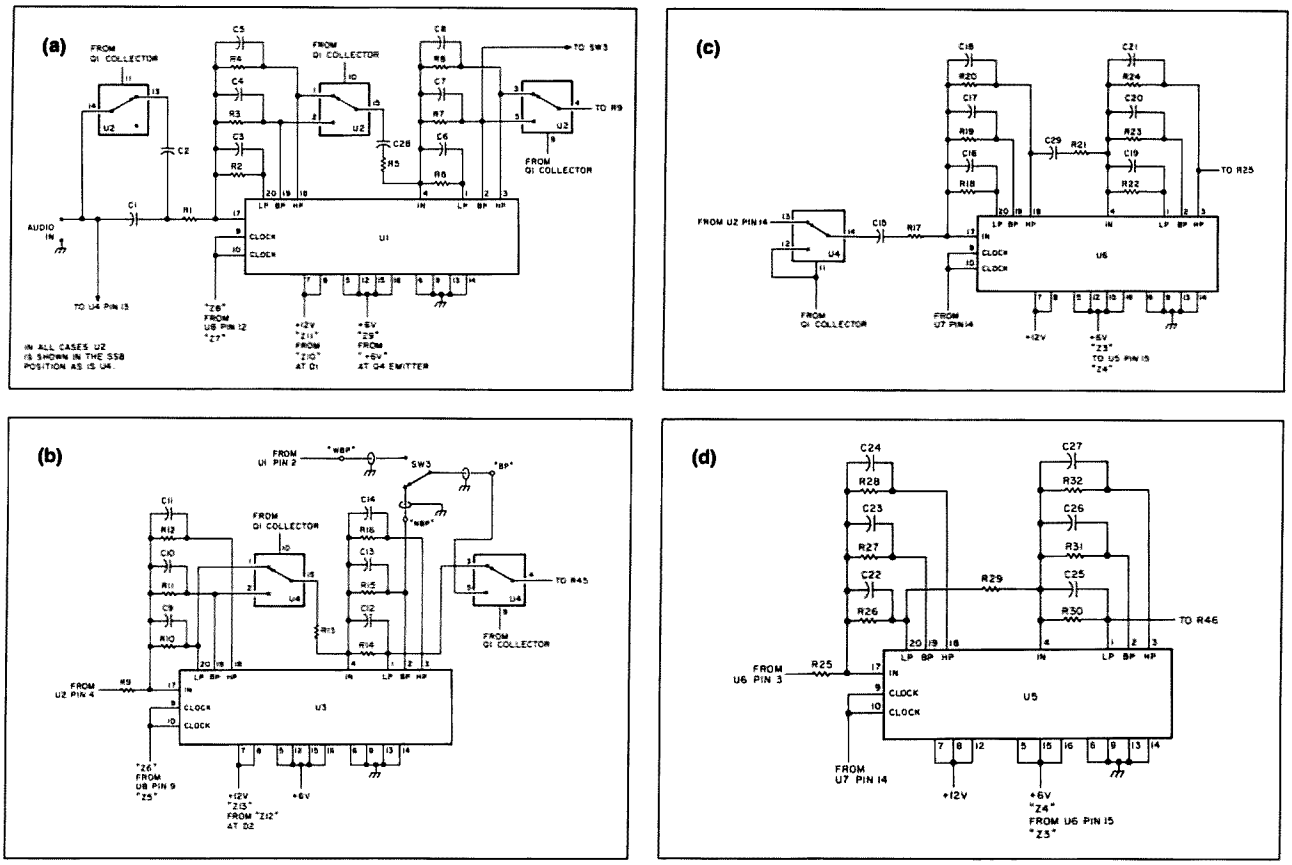

Fig. 2(a)-(d). Four National MF10s are cascaded to produce the desired filter shape.

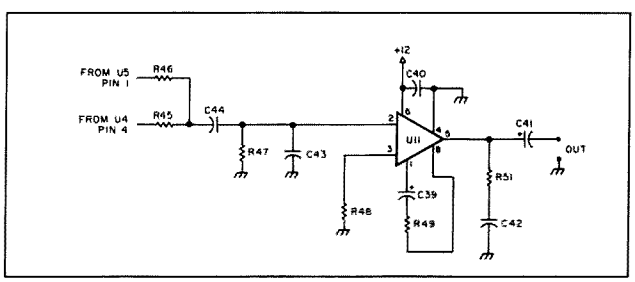

Fig. 2(e). Output driver.

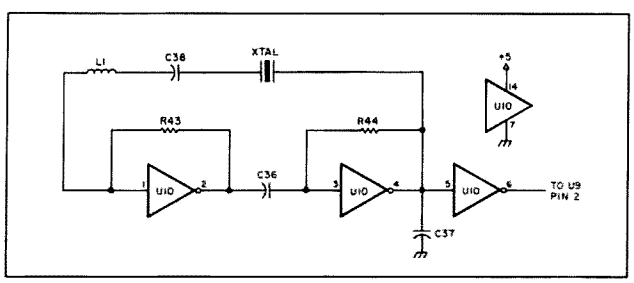

Fig. 2(f). System clock.

for CW mode by reducing response below 700 Hz. In SSB mode, C2 is switched in parallel with C1 to extend the response to below 500 Hz—Fig. 2(a). In the lower formant BPF, C28 provides additional rolloff below 400 Hz. The second formant BPF (U5 and U6) uses C15 and C29 similarly—Figs. 2(c) and 2(d).

The lower formant section is used for the CW filter. Since the bandwidth of the fourth cascaded BPF output is 350 Hz with an 800-Hz offset and is 300 Hz for a 700-Hz offset, it seems unnecessary to add more stages. There is a problem with very narrow CW filters in ease of receiver tuning and with receiver and transmitter drifts, which can require annoyingly frequent retuning of your receiver.

It is interesting to note that in the wide CW filter position you can understand SSB transmissions. While reception is not as clear as in SSB operation of the filter, it does remove a lot of background noise.

The CW BPF is created by switching the original topology of HP-HP-LP-LP to BP-BP-BP-BP via U2 (Fig. 2(a)), U4 (Figs. 2(b) and 2(c)), and Q1 (Fig. 2(i)). Each MF10 contains two filters that account for these HP and LP pairs. To keep the unused higher formant section from contributing noise in CW mode, its input is ac grounded by U4.

The output driver, U11 (Fig. 2(e)), will drive an 8-Ohm load with a 2-V rms signal. U11's gain is 20 without using R49 and C39, giving a total gain of 1:1 for the unit. Additional gain is available if R49 and C39 are added to the board. For example, R49 = 1,200 Ohms yields a gain of 50 in U11. C43 provides the final high-frequency rolloff.

SCF Theory

SCFs are basically integrators that are interconnected to provide HP, LP, BP, and NOTCH functions.

The active LPF, Fig. 3(a), has gain V2/V1 = $-1/(6.28 \times f \times R \times C)$. To show that resistor R can be replaced by switched capacitor C_s (which acts like an equivalent resistor, Req), consider Fig. 3(b).

During the portion of the clock signal that turns on Q1 and turns off Q2, capacitor C_s will acquire charge Q_s. When the clock signal changes state, Q1 will turn off and Q2 will turn on. The current flowing to the op amp will be $I_{in} = Q_s/(\text{unit time})$, where $Q_s = C_s \times V1$. The input current $I_{in} = V1/Req = Q_s/T$, where T is the clock period. Therefore, Req $= (V1 \times T)/Q_s = (V1 \times T)/(C_s \times V1)$, or Req $= T/C_s$.

Again, from Fig. 3(a) we know that V2/V1

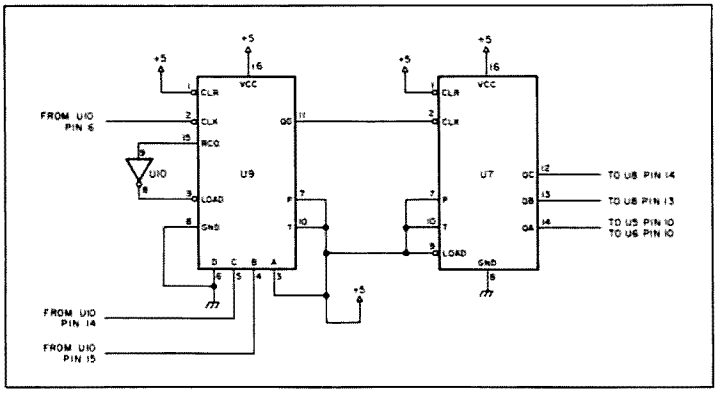

Fig. 2(g). Divider section.

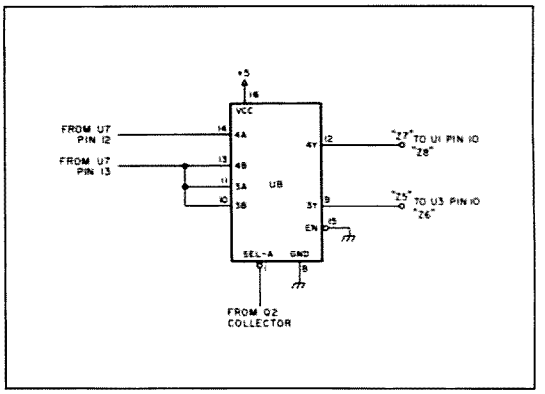

Fig. 2(h). Clock switch.

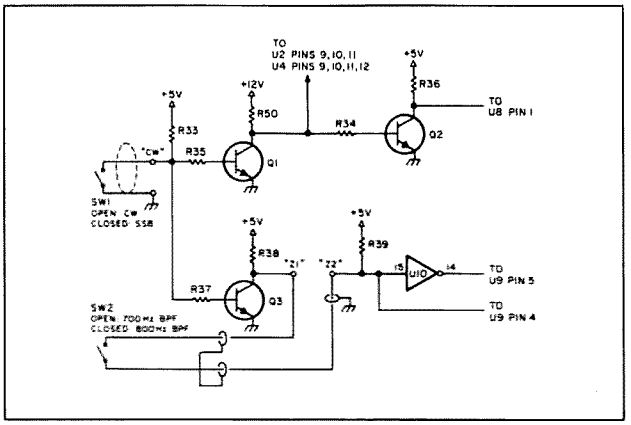

Fig. 2(i). Mode and offset selection.

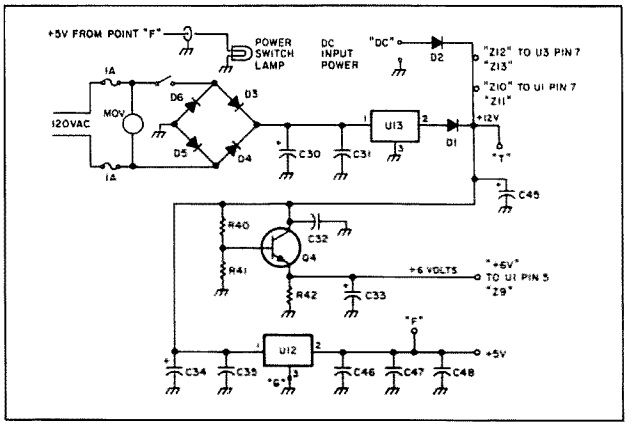

Fig. 2(j). Power supply.

$= -1/(6.28 \times f \times R \times C)$, so substituting Req for R we have $V2/V1 = -1/(6.28 \times f \times C \times T/C_s)$. We can see that R has been replaced by T/C_s and, more importantly, that the ratio of $C \times T/C_s$ is the gain-setting relationship which has replaced C x R.

The absolute values of C and C_s are not as important as their ratio, which can be set to great precision in the SCF chip. The clock can also be generated with high precision, so the main variable in the circuit's gain is the input frequency. A symmetrical clock signal is needed to provide equal charging and discharging time for C_s. There are many sources of data on SCF theory, so I will not go into more detail here.

A look at the MF10 in a data book shows nine different configurations for this versatile IC. The cutoff frequency or the bandpass frequency in each application circuit depends on resistor ratios and on the absolute value of the clock frequency. To keep the resistor ratios under control, along with their cost, I use resistor packs for these components. The absolute value of the R-packs is not as important as the ratio between the resistors on a given half of an MF10. This ratio in the R-packs is on the order of 0.5%.

Clock Generator

The clock is based on a 3.58-MHz crystal oscillator, U10, which is divided down by binary counters U9 and U7—Fig. 2(g).

SSB Clock

There is almost a harmonic relationship between the formants, and that fact is used to advantage in simplifying the clock generator.

The programmable divider, U9, is preloaded to 3 for a dividing ratio of 13 in SSB mode. The terminal count of the chip is 16, at which time the CARRY OUTPUT, pin 15, enables the LOAD pin via an inverter and loads the preset count at the next positive edge of the 3.58-MHz clock. The CARRY OUTPUT at 3.58/13 MHz is also used to clock U7, which is a binary counter producing the divide-by-2 and divide-by-4 ratios mentioned later.

In SSB mode, the 3.58-MHz signal is divided by 13 in U9 and then by 2 in U7 to produce a 137,674-Hz clock signal for the upper formant BPF.

An MF10 can be set for a clock/corner frequency ratio of 50 or 100. In the upper formant BPF, the X100 section, U5, has a passband starting at 1,376 Hz—Fig. 2(d). The following LPF section, U6, with its X50 ratio, has a passband ending at 2,753 Hz—Fig. 2(c). These two filters form a BPF from 1,376 to 2,753 Hz.

The lower formant BPF is wired for clocking at the X100 ratio in both U1 (Fig. 2(a)) and U3 (Fig. 2(b)) to simplify the switching between SSB and CW operation. To obtain the proper SSB clocks for the lower formant, the 137,674-Hz signal is divided by 2 for U3 and by 4 for U1 to yield 68,837 and 34,418 Hz, respectively, and a BPF of 344 to 688 Hz.

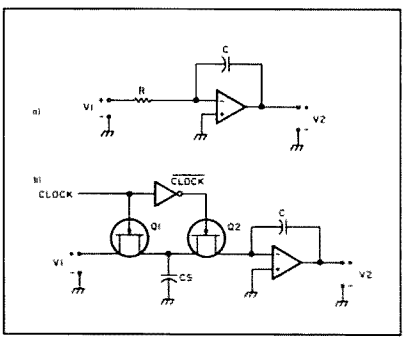

Fig. 3. The switched capacitor filter is derived from a simple active low-pass filter.

CW Clock

The lower formant BPFs, U1 and U3, require identical clock signals in CW mode, which are selected in U8 (Fig. 2(h)) as controlled by Q2 (Fig. 2(i)).

The two most popular CW offsets are 700 Hz and 800 Hz, which can be selected by switch SW2. In the case of a 700-Hz offset, the divider ratios are 13 and 4, which yield a 68,837-Hz clock signal. The X100 setup

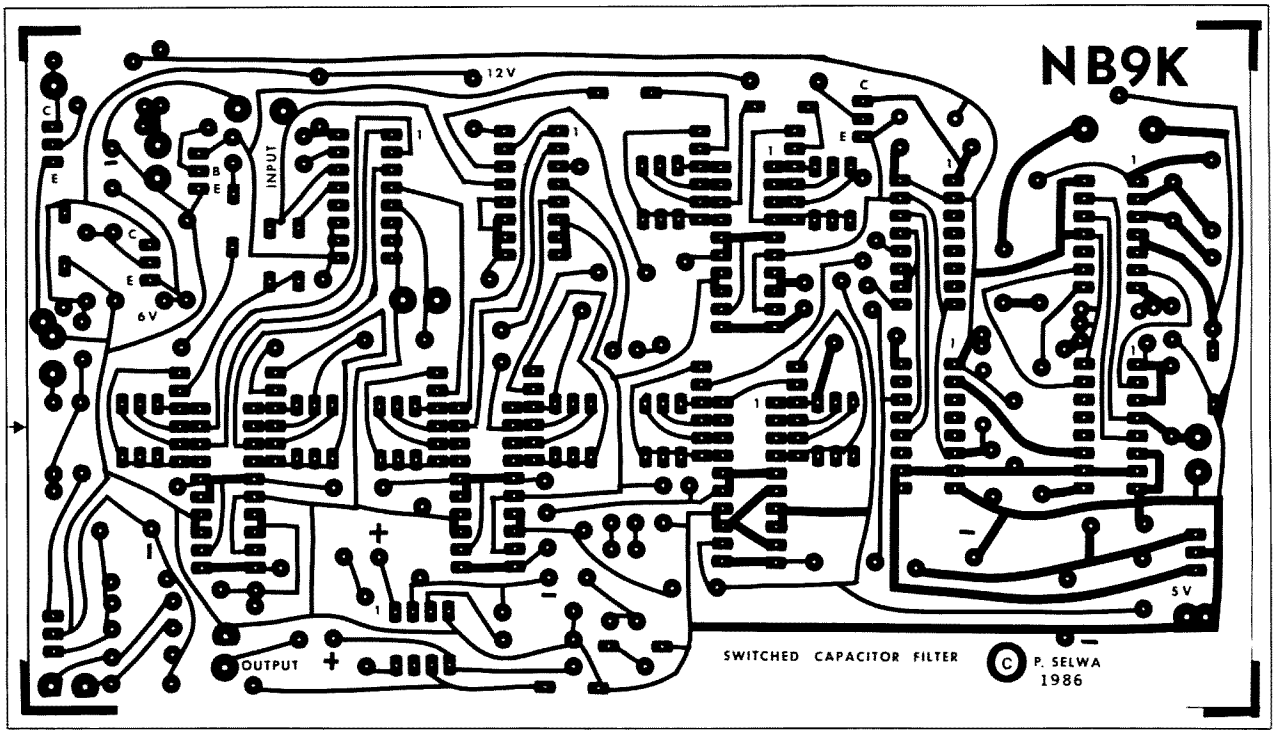

Fig. 4. Circuit board, foil side.

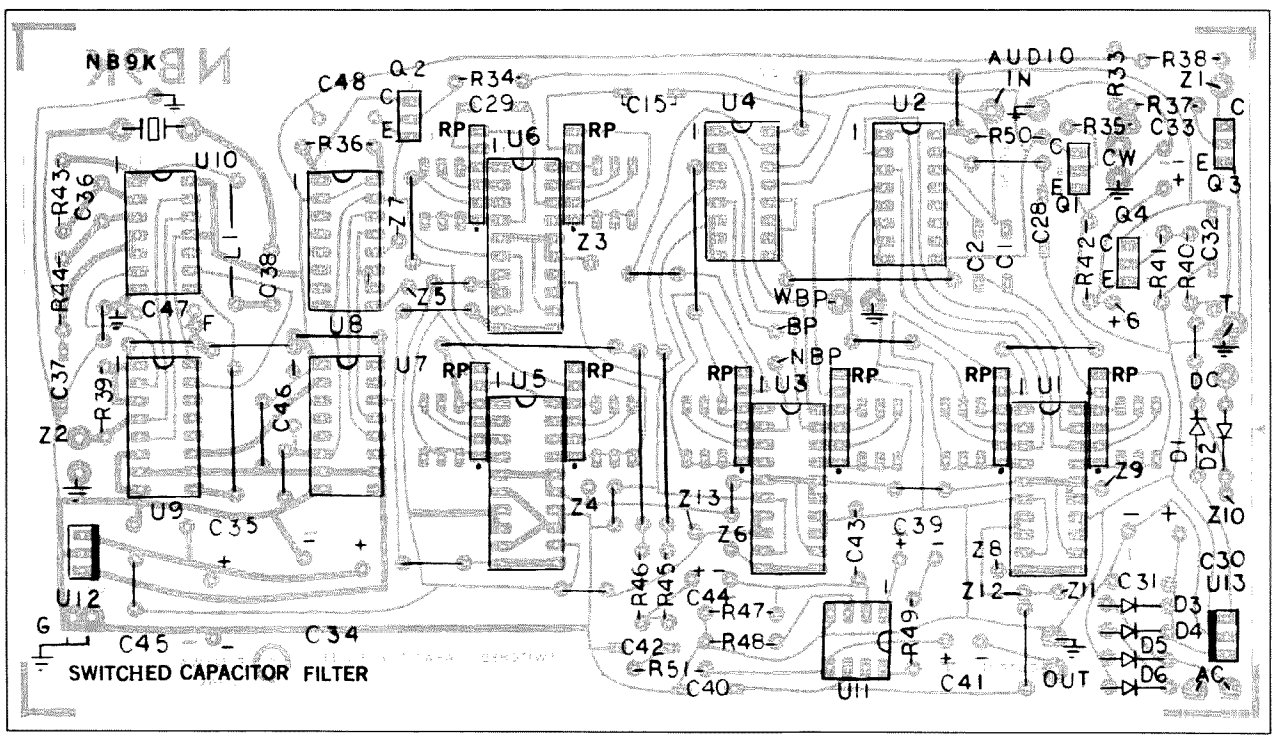

Fig. 5. Parts placement.

results in a 688-Hz BPF. If an 800-Hz offset is chosen, the dividers are 11 and 4 to produce a clock frequency of 81,353 Hz. The coupling caps for U1 cause the total response to peak at 732 and 846 Hz, but the response at 700 and 800 Hz is less than 0.2 dB down from maximum.

The clock signal for the upper formant gets changed during CW operation at 800 Hz since divider U9 (Fig. 2(g)) is set to 11 rather than to 13. The audio input to the upper formant BPF is ac grounded at U4 pin 14 (Fig. 2(c)) during CW mode so the output stage is not affected. Without this muting, the upper formant filter would produce interference acting as a BPF from 1,627 to 3,254 Hz.

Power Supply

The power supply is a conventional transformer/diode bridge/regulator combination. The 12-V regulator's output passes through

Parts List

C1, C28	0.018 uF
C2, C36	0.01 uF
C31, C32, C35, C40, C46, C47, C48	0.1 uF
C3–C14*

BUILD THE KIT

A complete set of parts, including everything required to build the kit, is available from Valley Electronics. The kit version is slightly different from the unit presented in this article. The kit includes the "optional" capacitor and resistor for additional gain, a headphone jack, and a filter in/filter out switch. The circuit board is double-sided, and the entire unit is housed in an attractive cabinet with wood-grain end panels.

Order Number	Description	Price
98601	Complete SCF Kit	$119.95

The price includes shipping and handling.

Send your check or money order to Valley Electronics, PO Box 1101, Hillsboro NH 03244.

diode D1, which protects the regulator from externally applied voltages—Fig. 2(j). An external dc power supply can be applied to the unit at point "DC" via diode D2 in the case of battery operation, or from the accessory socket on another piece of equipment. D2 protects against polarity reversals. You can apply an external dc supply through the diode bridge, but this requires about 17 volts to get regulated +12 volts. This unit draws about 75 mA dc with no signal applied. For low-level audio applications such as for headphones, a 12.6-volt transformer is enough to power the unit. For full capability, however, use an 18-volt power transformer. The +6-volt supply is for biasing the internal amplifiers in the MF10. Its exact value is not critical.

Assembly

There are no adjustments and there is nothing critical about assembling this project. All components are available from sources such as Digi-Key, Jameco, All Electronics, and Radio Shack.

The selection of CW or SSB mode is made by grounding point CW on the board with switch SW1 for SSB mode, or letting it pull up via R33 for CW mode—Fig. 2(i). The default CW filter is at 700 Hz, and you can select the 800-Hz BPF by connecting points "Z1" and "Z2" with switch SW2. Select the narrow or wide CW BPF by connecting SPDT switch SW3 to points NBP, WBP, and BP with the pole at BP. In addition to the jumpers shown as straight lines on the parts placement diagram, connect the points: Z3–Z4 (Figs. 2(c) and 2(d)), Z5–Z6 (Figs. 2(b) and 2(h)), Z7–Z8 (Figs. 2(a) and 2(h)), +6–Z9 (Figs. 2(a) and 2(j)), Z10–Z11 (Figs. 2(a) and 2(j)), and Z12–Z13 (Figs. 2(b) and 2(j)). Point "F" is a +5-volt pickoff and point "T" is a +12-volt pickoff for pilot lights—Fig. 2(j).

To avoid hum problems, use shielded wire wherever possible. There is a point to ground the crystal's can, and there are holes near U12 labelled "G" to use in making ground connections—Fig. 2(j). I had to connect from "G" to ground at the rear-panel output jack to take out hum.

Space is provided for an LC resonant circuit (L1, C38) in series with the crystal in case yours requires it to operate correctly; otherwise, jumper their spaces—Fig. 2(f). Add C37 to aid in oscillator startup as required.

There is room for IC sockets, and the spaces for the resistor SIP packs are laid out so they can be inserted in either direction, but the dot on the component layout marks the common point (the MF10's input summing junction). Capacitors C3–C14 (Figs. 2(a) and 2(b)) and C16–C27 (Figs. 2(c) and 2(d)) are shown on the schematic and there are holes on the board for them, but they are there for experimentation and the unit works fine without them. Check a data book for the internal schematic of the MF10 before adding any of those caps.

The 12-V regulator requires a heat sink, but the 5-V regulator does not unless you use TTL equivalents in the clock generator. ■

One Band, One Transistor

Build this tiny ham band receiver and put the world in your pocket.

Number 8 on your Feedback card

Here is a very simple little receiver that most anyone electronically inclined can build. You can use it to listen to your favorite ham band when you're away from the shack.

The circuit in Fig. 1 is configured for the 80m band. All of the parts can be found in your local Radio Shack store. A good way to build this project would be to use a single-sided printed circuit board. Additionally, you will need either a 9-volt or a 12-volt battery, an audio amp module (you can build your own using a 741 IC; I will send a wiring diagram to you for an SASE), and 8-Ohm headphones. The 365-pF broadcast-band variable capacitor should have a vernier drive (six-to-one ratio), which makes tuning easier by separating the stations on the dial. A good antenna and ground are also recommended.

With just a few changes in capacitance and inductance values, this receiver should work well on other ham bands. For example, you could install the receiver in a broadcast-band transistor radio. Instead of using an external audio amp, you would use the one in the radio—just run a wire from the wiper of the 10k volume control to the middle terminal of the volume control in the broadcast receiver. You should connect the grounds of the two radios together. The 9 or 12 volts needed to power the one-transistor radio would be taken from the on/off switch on the back of the volume control.

The Radio Shack iron-core chokes (276-101) that are used in the bfo part of the circuit can be calibrated by listening for the bfo signal in a calibrated receiver. This bfo coil is placed in a horizontal position in relation to the copper foil of the printed circuit board, and the distance between the side of the bfo coil and the copper foil of the printed circuit board determines the band edge's low and high limits. Tuning of the bfo coil is accomplished by varying the distance between the side of the bfo coil and the copper foil. The inductance value of the bfo coil is 10 mH.

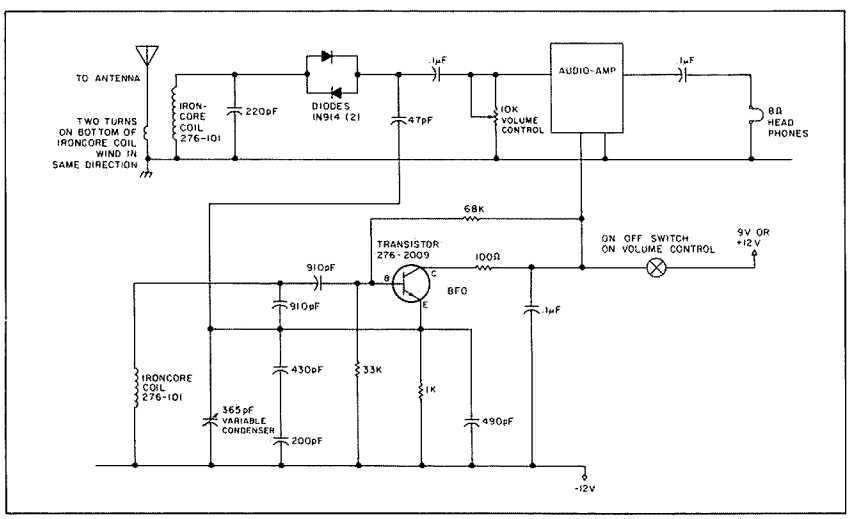

Fig. 1. This tiny single-band receiver will fit into your pocket.

"With just a few changes in capacitance and inductance values, this receiver should work well on other ham bands."

This one-transistor receiver also could be made into a very small pocket ham-band receiver, which would be good for SWLs and hams to listen to when away from home, to keep in touch with their favorite nets and skeds. It may be possible to increase the volume by installing a small output transformer (500 to 8 Ohms) between the output terminals on the other side of the .1-uF capacitor. Run the 500-Ohm side to the capacitor and ground, and the 8-Ohm side to the 8-Ohm headphones.

I hope you enjoy building and operating this simple receiver. If you have any questions, you can write to me at the address at the beginning of this article. ■

SPECIAL EVENTS

WEST COVINA CA
OCT 4

The Southern California Amateur Transmitting Society will sponsor Scatcon '86 on October 4, from 9 a.m. to 3 p.m., at Cortez Park, 2441 Cortez Avenue, West Covina, California. $2 donation. Talk-in on 147.765/.600. For more information, call Bob N6NGN at (818)-917-6470.

NORWOOD NJ
OCT 4

The Orange County ARC will hold its hamfest and auction on October 4, from 9 a.m. to 3 p.m., at John S. Burke Catholic High School. Admission is $3. Tables $7, tailgating $3. License exams begin at 9 a.m. Talk-in on 146.76 and 146.52. For more information, call Bob WB2ENA at (201)-767-6698.

CINCINNATI CLUB 50TH
OCT 4

The Greater Cincinnati ARA invites all amateurs to work club station W8DZ to help them celebrate 50 years of service. Frequencies just inside the General phone bands and 45 kHz up on CW will be used. For a facsimile stock certificate of one share of Cincinnati, send QSL, address label, and a 22-cent stamp to W8GS, 620 Woodsway Drive, Loveland OH 45140.

WARRINGTON PA
OCT 4–5

The Pack Rats (Mt. Airy VHF ARC) will hold the 10th annual Mid-Atlantic VHF Conference on October 4 at the Warrington Motor Lodge, and the 15th annual Pack Rat Hamarama on October 5 at the Bucks County Drive-In Theater, Rte. 611, Warrington, Pennsylvania. Admission to the flea market is $5 per carload, with selling spaces $6 each. The gate will open at 6 a.m. Bring your own tables. Advance registration for the conference is $4. Send payment to Hamarama '86, PO Box 311, Southampton PA 18966, or call Pat Cawthorne WB3DNI at (215)-672-5289.

SPRINGFIELD OH
OCT 5

The Independent Radio Association will hold its 4th annual Springfield, Ohio, Hamfest and Computer Expo on October 5, from 8 a.m. to 4 p.m., at Clark County Fairgrounds, a quarter mile west of the intersection of I-70 and Ohio Rte. 41 (Exit 59). Admission is $3, $2 in advance, children under 12 free. Tables are $7, $6 in advance. Talk-in on 145.45. For advance reservations, write the Independent Radio Association, PO Box 523, Springfield OH 45501, or call Steve KA8QCS at (513)-882-6521.

ST. JOSEPH MI
OCT 5

The Blossomland ARA will hold its Blossomland Blast on October 5. For more information, write "Blast," PO Box 175, St. Joseph MI 49085.

COLUMBIA MD
OCT 5

The Columbia ARA will hold its 10th annual hamfest on October 5, from 8 a.m. to 3:30 p.m., at the Howard County Fairgrounds (15 miles west of Baltimore just off I-70 on Rte. 144, one mile west of Rte. 32). Admission is $3, XYLs and children free. Tables are $7 if payment is received by Sept. 30, $8 afterwards. Outdoor tailgating $3, indoor tailgating $6. Talk-in on 147.735/.135 or 146.52. For table reservations and information, contact Mike Vore W3CCV, 9098 Lambskin Lane, Columbia MD 21045; (301)-992-4953.

YONKERS NY
OCT 5

The Yonkers ARC will sponsor the Yonkers Electronics Fair and Flea Market on October 5, from 9 a.m. to 4 p.m., at the Yonkers Municipal Parking Garage (corner of Nepperhan Avenue and New Main Street). Admission is $3, children under 12 free. Sellers, $7 per parking space. Talk-in on 146.865, 440.150, and 146.52. For further information, contact YARC, 53 Haywood Street, Yonkers NY 10704; (914)-969-1053.

ROME GA
OCT 5

The Coosa Valley ARC will hold the Rome, Georgia, Hamfest on October 5 at the Rome Civic Center on GA 20, across from Shoney's. Admission is free. Inside tables $5, outside spaces $2. Exams begin at 8 a.m. For more information, contact Bobbie Carol Waller KA4DXU, 24 Wellington Way, SE Rome GA 30161; (404)-235-5417.

ALFALFA COUNTY OK
OCT 5

The Salt Plains ARC will hold its annual Ham Social on October 5 at Salt Plains Lake in northern Alfalfa County, Oklahoma. Talk-in on 147.30/.90.

CORRECTIONS

In the QRP column in the July, 1986, issue (p. 83): The table on the left shows "Lengths of quarter-wavelength ground radial wires"; the table on the right shows "Resonant lengths of wire."

An error crept into Tom Miller's universal frequency display, "What You See Is Where You're At: Part II," in the May, 1986, issue. Please add an extra divide-by-ten stage as shown in Fig. 1.

USING THE AO-10 PREDICTIONS

Apogee predictions for the month of October are provided for three sections of the United States: Washington, D.C.; Denver, Colorado; and Los Angeles, California. Times are in UTC and apogee in this case is mean anomaly 128 rounded to the nearest whole hour. Use the chart as a guide in aiming your antenna, then fine-tune the azimuth and elevation values to peak the satellite's beacon signal. If you require more accurate orbital predictions, contact AMSAT at PO Box 27, Washington DC 20044.

ROCK HILL SC
OCT 5

The York County ARS will hold the Rock Hill Hamfest on October 5, beginning at 7 a.m., at Joslyn Park on Lake Wylie, in Rock Hill, South Carolina. Pre-registration is $3, $4 at the gate. Talk-in on 146.43/147.03. For more information, contact J. George Trunk N4MCJ, 1158 Wendy Road, Rock Hill SC 29730; (803)-327-4344.

VIRGINIA BEACH ARC 25TH
OCT 5–6

The Virginia Beach ARC invites all hams to help celebrate its 25th anniversary by contacting club station WA4TGF on October 5–6. Operation will be on the following frequencies, ±5 kHz: CW—3.540, 7.040, 14.040, 21.040, and 28.040; SSB—3.890, 7.240, 14.250, 21.340, and 28.560. To receive a special 8 x 10 QSL certificate, send a 9 x 12 envelope and two first-class stamps to R. C. Brown, VBARC, 4821 Rosecroft Street, Virginia Beach VA 23464.

WASECA MN
OCT 11

The Viking ARS will hold its 16th annual swapfest at the Waseca High School on Saturday, October 11. Doors open at 8 a.m. ARRL VEC testing, walk-ins only. Talk-in on .34/.94. Contact VARS, PO Box 3, Waseca MN 56093.

COLUMBUS EVENTS
OCT 11–12

The Columbus ARA will hold the Fourth Annual Columbus Day Special Event on October 11–12 as a triple salute to explorer Christopher Columbus, the city of Columbus, Ohio, and amateur radio worldwide. CARA club station W8TO will operate as a citywide special-event station. For a complete list of rules, write to Amateur Radio Station W8TO, Attn. Special Event Coordinator, 280 East Broad Street, Columbus OH 43215.

IKE B'OAY
OCT 11–12

The Texoma ARC will operate special-event station K5GQD from Denison, Texas, birthplace of President Dwight D. Eisenhower, to commemorate the 96th anniversary of his birth. Operation will be from 1400 UTC October 11 until 2400 UTC October 12 on SSB in the General-class portions of the 2-, 10-, 15-, 20-, 40-, and 75-meter bands. For an 8-1/2 x 11 certificate, send a QSL and a large SASE to K5GQD, 1303 E. Richards, Sherman TX 75090.

MEMPHIS TN
OCT 11–12

The Mid-South ARA and allied clubs will hold their annual hamfest at a new location this year, at the Shelby County Agricenter, from 8 a.m. to 5 p.m. on October 11 and from 9 a.m. to 4 p.m. on October 12. Directions: Poplar Ave. to Germantown (Germantown Road), north about 6 miles; or take Exit 13 on I-240 (Walnut Grove) and go east. Flea-market spaces are $6 each per day, tables provided. Non-ham XYLs and children admitted free. Exams will begin at 9 a.m. on Saturday. Talk-in on .28/.88 or .22/.82. For further information, contact Clayton Elam K4FZJ, 28 North Cooper, Memphis TN; (901)-274-4418 (days) or (901)-743-6714 (nights).

WICHITA KS
OCT 11–12

The Kansas ARRL Convention will be held October 11–12 at the Holiday Inn Plaza, 250 W. Douglas, Wichita KS 67202. The convention opens at 9 a.m. both days. $5 pre-registration, $6 at the door, non-amateurs $3. VE exams given. Talk-in on 146.82. WØSOE is the official talk-in station. For more information, contact Kansas ARRL Convention, Clarence Reid KØBHJ, 1520 W. 16th, Wichita KS 67203.

WARNER ROBINS GA
OCT 11–12

The Central Georgia ARC will sponsor the 8th annual Central Georgia Hamfest and the 1986 Georgia State ARRL Convention on October 11–12, from 8 a.m. to 5 p.m. on Saturday and from 8 a.m. to 3 p.m. on Sunday, at the Warner Robins Recreation Center, 800 Watson Blvd., Warner Robins, Georgia. Admission is free. Plenty of tailgate space. Exams given both days at 9 a.m. Talk-in on 146.25/.85. For more information, write to CGARC, PO Box 2585, Warner Robins GA 31099.

TEXAS HERITAGE
OCT 11–18

A mobile special-event station (using callsigns N5IWA, N5OUK, and KA5JHT) will be operating on October 11–18 in conjunction with the Texas Heritage Excursion Rallye (T.H.E. Rallye), which is a Texas Sesquicentennial activity sponsored by the Pro-Texas Foundation and the Sports Car Club of America. Stations will be operated on the Novice segments of the 40- and 80-meter bands and on the General segments of the 20-, 40-, and 80-meter bands. For a commemorative QSL, send a QSL and an SASE to Hal Collins KA5JHT, PO Box 473068, Garland TX 75047-3068.

LIMA OH
OCT 12

The Northern Ohio ARC will hold its annual Allen County Hamfest on October 12, at Allen County Fairgrounds in Lima, Ohio, located one mile east of I-75, Exit 125A, on State Rte. 309 or 117. Tickets are $3 in advance or $3.50 at the door. $6 for a full table, $3.50 for a half table. Talk-in on 146.67 and 146.52. Exams given. For more information or reservations, send an SASE to NOARC, Box 211, Lima OH 45802.

PUMPKIN FESTIVAL
OCT 15–18

The Teays ARC will operate special-event station WB8PPH on October 15–18 to commemorate the annual Circleville Pumpkin Festival. Operation will be in the General phone bands for the following times: October 15, 1700–0100 UTC; October 16–18, 1500–0100 UTC. For a commemorative certificate, send a QSL and an SASE to Len Campbell WB8PPH, 8951 State Route 188, Circleville OH 43113.

NBS 85TH
OCT 17–18

The Bureau Radio Amateur Signal Society (NBS BRASS) will operate special-event station K3AA from 2100–0200 UTC on October 17 and from 1300–0100 UTC on October 18, from the grounds of the National Bureau of Standards, in celebration of the 85th anniversary of the founding of the Bureau. Frequencies: phone—3.900, 7.235, 14.235, and 21.360; CW—3.535, 3.710, 7.035, 7.110, 14.035, 21.035, and 21.110; packet—20m. For a commemorative certificate, send a large SASE to NBS BRASS, National Bureau of Standards, Gaithersburg MD 20899.

SYRACUSE NY
OCT 18

The Radio Amateurs of Greater Syracuse will hold its 31st hamfest on October 18, from 9 a.m. to 5 p.m., in the Arts and Home Mansion at the New York State Fairgrounds, just two miles east of Thruway Exit 39 on Rte. 690. Admission is $4, children under 12 free. Tailgating $3 per car. Indoor flea market $6 per table. Talk-in on 146.31/.91 and 147.90/.30. Exams begin at 12 noon. For more information, call Ed Swiatlowski WA2URK at (315)-487-3417 or Viv Douglas WA2PUU at (315)-469-0590, or write RAGS, PO Box 88, Liverpool NY 13088.

JAMBOREE ON THE AIR
OCT 18–19

The World Bureau of the World Organization of the Scout Movement will sponsor Jamboree On The Air, an annual scouting/ham radio event, from 0001 local time on October 18 to 2400 local time on October 19. Look for K2BSA, the BSA headquarters station in Ft. Worth, Texas, and for HB9S, the World Scout headquarters in Switzerland, and for other special callsigns from many countries. Frequencies: CW—3.590, 7.030, 14.070, 21.140, and 28.190; voice—3.940, 7.290, 14.290, 21.360, and 28.990; packet, RTTY, SSTV, and ATV on usual frequencies. Check the Novice frequencies. K2BSA will be operating on OSCAR 10. Postcard-sized certificates are available free to all participants and may be ordered beforehand for presentation during JOTA. Send requests to Jamboree on the Air Certificates,

BUILD THE DXER'S SCF

A complete kit to build the switched capacitor filter featured on page 46 is available from Valley Electronics. This kit version includes the "optional" capacitor and resistor for additional gain, a headphone jack, and a filter in/filter out switch. The circuit board is double-sided, and the entire unit is housed in an attractive cabinet with wood-grain end panels.

Order Number	Description	Price
98601	Complete SCF Kit	$119.95 ppd.

Send your check or money order to:

Valley Electronics

PO Box 1101, Hillsboro NH 03244.

SYNTHESIZED
SIGNAL GENERATOR

MADE IN USA

MODEL SG-100F $429.95 delivered

• Covers 100 MHz to 199.999 MHz in 1 kHz steps with thumbwheel dial • Accuracy +/– 1 part per 10 million at all frequencies • Internal FM adjustable from 0 to 100 kHz at a 1 kHz rate • External FM input accepts tones or voice • Spurs and noise at least 60 dB below carrier • Output adjustable from 5-500 mV at 50 Ohms • Operates on 12 Vdc @ ½ Amp • Available for immediate delivery • $429.95 delivered • Add-on accessories available to extend freq range, add infinite resolution, AM, and a precision 120 dB attenuator • Call or write for details • Phone in your order as fast COD shipment.

VANGUARD LABS

196-23 Jamaica Ave., Hollis, NY 11423

Phone: (718) 468-2720 Mon.–Thurs.

Save Time-Money with HAZER

• Never climb your tower again with this elevator system.
• Antenna and rotator mount on HAZER, complete system trams tower in verticle upright position.
• Safety lock system on HAZER operates while raising-lowering & normal position. Never can fall.
• Weight transferred directly to tower. Winch cable used only for raising & lowering. Easy to install and use.
• Will support most antenna arrays.
• Safety - speed - convenience - inexpensive.
• Complete kit includes winch, 100 ft. of cable, hardware and instructions. For Rohn 25 G Tower.

↙72

Hazer 2-Heavy duty alum., 12 sq ft. ld. **$297.00 ppd.**
Hazer 3-Standard alum., 8 sq ft. load **213.00 ppd.**
Hazer 4-Heavy galv. steel, 16 sq ft. load **278.00 ppd.**
Ball thrust bearing TB-25 for any of above **42.50 ppd.**
Satisfaction guaranteed. Call today and charge to Visa or MasterCard.

As an alternative, purchase a Martin M-13 or M-18 aluminum tower engineered specifically for the HAZER system, or a truly self-supporting steel tower. Send for free details.

GLEN MARTIN ENGINEERING INC.
P.O. Box C 253 Boonville, Mo. 65233
816-882-2734

1325 Walnut Hill Lane, Irving TX 75038-3096. Include an SASE with 22 cents postage for the first 10 cards, 17 cents for each additional 10 cards.

ST. CHARLES IL
OCT 18–19

The Fox River Radio League will sponsor an ARRL Central Division Convention as part of its Hamtastic Weekend on October 18–19, from 10 a.m. to 4 p.m on Saturday and from 9 a.m. to 2 p.m. on Sunday, at the new Norris Sports Center, just off Rte. 64 in St. Charles, Illinois, 35 miles west of Chicago. Tickets good for both days are $3 in advance or $4 at the door. Exams will be given. Talk-in on 144.870/145.470 and 144.610/145.210. For advance tickets or for information on tables or exams, contact Bill Heimann WD9WE, 837 Lebanon Street, Aurora IL 60505; (312)-859-1171. Include an SASE.

ST. PETERSBURG FL
OCT 18–19

The Florida Gulf Coast Amateur Radio Council presents the ARRL South Florida Section Suncoast Convention on October 18–19, from 9 a.m. to 4 p.m., at the National Guard Armory in St. Petersburg, Florida. The convention hotel is the Holiday Inn I-275. Admission is $4 in advance, $5 at the door. Swap tables are $12 for both days. Flea-market area and all exhibits are indoors. For further information, write to FGCARC, PO Box 157, Clearwater FL 33517.

LAKE TEXOMA OK
OCT 24–26

The Texoma Hamarama Association will hold its Hamarama '86 on October 24–26 at Lake Texoma Lodge on Catfish Bay, in Lake Texoma, Oklahoma, near Kingston. Exams will be given. For additional information, contact Texoma Hamarama Association, PO Box 610892, DFW Airport TX 75261.

POQUETANUCK CT
OCT 25

The Tri-City ARC will hold its fourth annual auction on October 25, beginning at 10 a.m., at the St. James Parish Hall, Poquetanuck, Connecticut, 1-1/2 miles east of Rte. 12 on Rte. 2A (south of Norwich). Free admission. Talk-in on 146.52. Call WA2RYU at (203)-464-6555 for further information.

BARBECUE FESTIVAL
OCT 25

The Healing Springs Mtn. VHF Society will operate special-event station WD4BBQ on October 25, from 1300–2100 UTC, for the 3rd annual Lexington Barbecue Festival. Operation will be on 40m, 20m, and 15m. Phone: 25 kHz up from the edge of the General-class band. Novice band: 7.125 as time permits. Also area 2m repeaters. For a special Bar-B-QSL, send an SASE to Healing Springs Mtn. VHF Society, PO Box 41, Lexington NC 27293-0041.

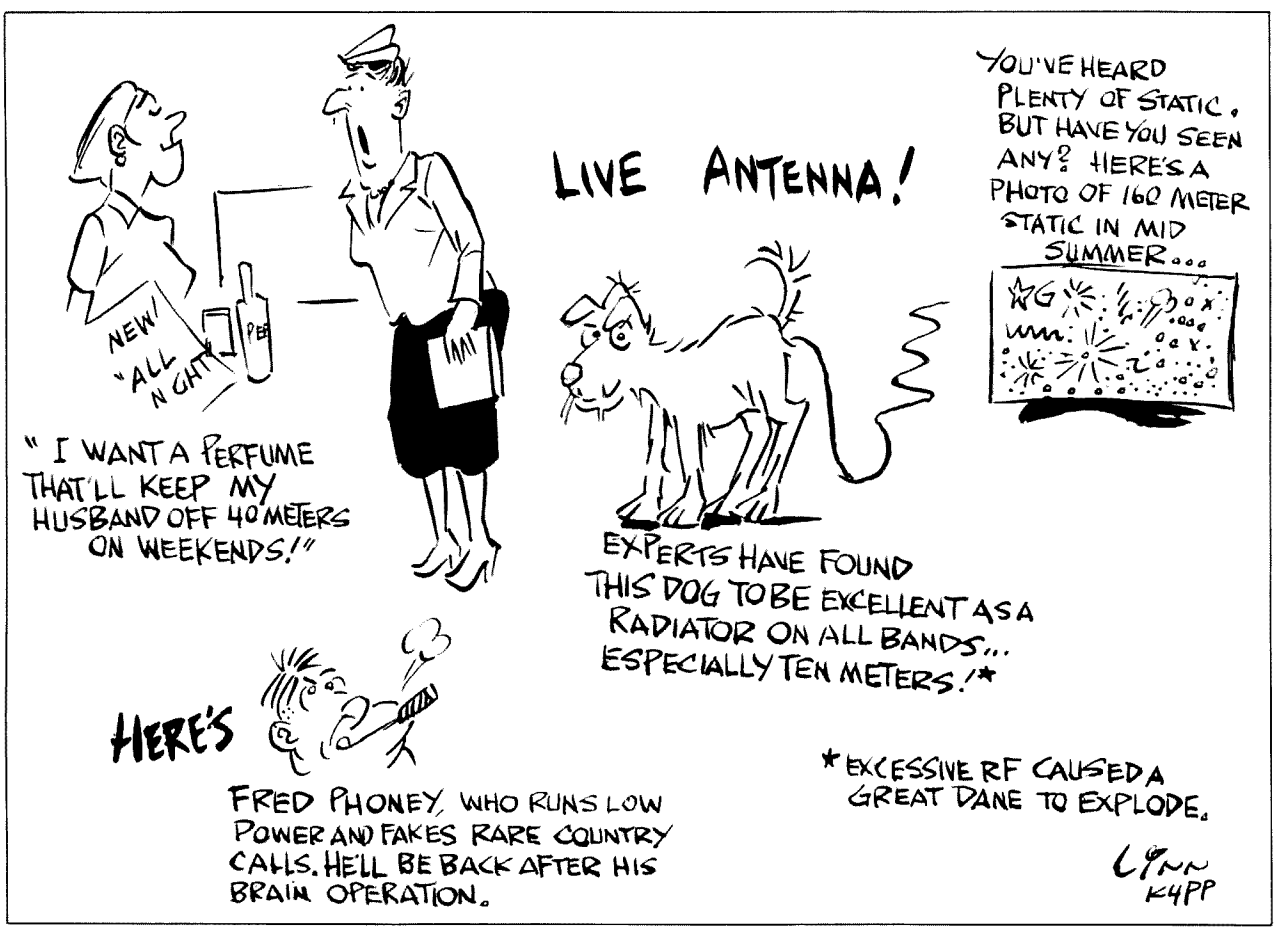
LONDON ONT
OCT 26

The London ARC will hold a flea market on October 26 from 9 a.m. to 2 p.m. Admission is $2, $3 for vendors. Talk-in on 147.060. For more information, contact London ARC, c/o John Pedersen VE3MGR, PO Box 82, Stn. B, London, Ontario N6A 4V3 Canada; 472-6506 after 6 p.m.

FRAMINGHAM MA
OCT 26

The Framingham ARA will hold its annual fall flea market and exams on October 26, beginning at 10 a.m., at the Framingham, Massachusetts, Civic League building, 214 Concord Street (Rte. 126). Admission is $2. Tables $10 (includes one free admission). Talk-in on .75/.15. Pre-registration required for tables and exams. Contact Jon Weiner K1VVC, 52 Overlook Drive, Framingham MA 01701; (617)-877-7166.

KALAMAZOO MI
OCT 26



The Kalamazoo ARC will hold its 4th annual Hamfest and Radio Swap on October 26, from 9 a.m. to 2 p.m., at the Kalamazoo County Fairgrounds, 2900 Lake Street, Kalamazoo, Michigan (halfway between Chicago and Detroit). Admission is $2 in advance, $2.50 at the door. Talk-in on 147.00+. 8-foot table space $6. For reservations, contact Ken KA8RUA, 2825 Lake Street, Kalamazoo MI 49001; (616)-345-4609 (work). Exams given. For information, contact Al Nelson K8OQB, 10603 Cora Drive, Portage MI 49081; (616)-323-3812.

MARION OH
OCT 26

The Marion ARC will hold its 12th annual Heart of Ohio Ham Fiesta on October 26, from 8 a.m. to 4 p.m., at the Marion County Fairgrounds Coliseum. Tickets are $3 in advance, $4 at the door. Tables $5. Talk-in on 146.52 or 147.90/.30. For more information, tickets, or tables, contact Ed Margraff KD8OC, 1989 Weiss Avenue, Marion OH 43302; (614)-382-2608.

LAS VEGAS NV
NOV 7–8

HAM/WEST and the ARRL Nevada State Convention, will be held all day November 7 and 8 at the Hacienda Hotel in Las Vegas, Nevada. Advance registration is $12 before October 24 or $15 at the door. For all info, see the ad in this issue or contact HAM/WEST, PO Box 19675, Las Vegas NV 89132; (702)-361-3331.

NK6K > PACKET

Number 22 on your Feedback card

Harold Price NK6K
1211 Ford Avenue
Redondo Beach CA 90278

HOW FAST IS 2400?

Well, instead of being on the air, I'm sitting here talking to you. It's not entirely your fault, though, since there are several other things I'm behind on. Besides, I still haven't cleaned the dirt out of the key that I/O the dog is playing with on page 84 of the August issue, and that's the only key I own. For the record, I/O remains uncertain about the future of CW, and dug the key up again.

Speaking of the big *73* packet issue, as I write this, I haven't seen it yet. I hope you liked it, and I hope you filled out the bingo card to tell us which articles you liked most and sent it in so I'll have an idea of what you want to see more (or less) of in the way of packet.

I learned several things while working on that issue, the foremost being never to be specific about the launch date of a satellite in a publication with a longer than two-day lead time. While the packet issue was in final processing, the Ariane program lost a flight (V18) and the AMSAT Phase 3C launch (V21) has been postponed. There is, as of yet, no new date, and I wouldn't mention it now even if there were.

As of this month, the packet column contains some information at a slightly higher than beginner level. On a scale of 1 to 10, 10 being esoteric ivory-tower stuff, I'll try to keep it in the 3 to 5 region for a while. That's the way my mail has been leaning, and the August issue should have satisfied the very introductory level needs for some time to come. Think of this as the beginner's guide to intermediate packet topics. It's been shown that it is easier learning Morse code if you take it at a reasonable speed to start with. That's what Wayne says, and he's never been wrong before, right? So I'll toss in some "reasonable difficulty" packet topics to help you get your packet IO raised quickly, and you'll have a month to rest up in between. This month's topics are: "Is 2400 baud really twice as fast as 1200?" and some of the issues raised at the June Digital Committee meeting.

Dallas Hamvention

I attended the Dallas Hamvention in May. The Dallas gang always puts on a good show, and this year was no exception. They take the time to do it right, and spend some of the proceeds to fly in the best guest speakers (blush). They have a lot of vendors and a large swap meet.

This year, several packet manufacturing companies were present. A 2400-bps packet-radio modem was demonstrated at this show, although it was not yet available for purchase. The question heard most often was, "Is 2400-bps packet really twice as fast as 1200-bps packet?" The sad but true answer is, "No, not by a long shot."

The reason for that is transceiver turnaround time—and I'll use that as a lead-in to something a few letters have asked me to discuss: TXDELAY and DWAIT. Sit back and I'll tell you all about it.

Packet's Black Hole

In the pre-digital days, no one really cared how long it took between the time the other guy's hand gripped the microphone on one radio and when the words started coming out of the speaker on another radio. As long as no delay was noticeable to the human senses, the process was fast enough. There was no "black hole" turnaround time. Even if the process took a half second or a bit more, the most that would be missed would be part of a syllable. And since there is usually a long interval of time between the hand clench and the unclench, the percentage of syllables lost in any one transmission is vanishingly small. If the radios take 1/2 second to turn on and the total transmission is 60 seconds, the time wasted is 0.83%.

Then came packet, where half a second is time enough for 60 characters to be missed at 1200 baud. If a packet takes .6 seconds to send and the turn-on time is .5 seconds, 45% of the time is wasted. Fortunately, most radios are faster than .5 seconds, but some are not much faster.

In packet, we are very interested in the total turnaround time. A radio has three timing parameters of interest here: the time it takes between when the push-to-talk (PTT) line is asserted and when stable rf is being emitted (key-up time), the time it takes between when the PTT line is released and when the radio is ready to receive again (un-key time), and the time it takes the receiver to lock up and unsquelch (RX start time). For the purposes of this discussion, we'll define turnaround time as un-key time plus receive time.

It is your radio's turnaround time that usually will determine the minimum time that the station you are talking to must wait before it starts to send data. This is because the sum of your un-key and receive time is usually larger than the other station's key-up time. One turnaround-time interval must pass between the end of a frame that you transmit and the start of a frame the other station transmits. This relationship is shown in Fig. 1.

The other station does not have a direct adjustment parameter for your turnaround time; it has only one for its key-up time. This is called TXDELAY. Most hams set a TXDELAY that is far larger than what is actually needed for their own key-up time. This is fortunate; otherwise, many packets would be lost due to the turnaround-time black hole. Note that each station in the local-area net must set a TXDELAY that is long enough to make up for the slowest turnaround-time station in the net. Otherwise, the slow station would have no one to talk to because its receiver would never be ready in time to hear the acknowledgments sent in response to packets it had transmitted.

So far, we've seen one place where time consumed in sending packets is unrelated to the amount of data sent or the speed it is sent at. A second delay is DWAIT. The DWAIT parameter adds additional wait time between when the frequency goes clear and when your station will try to go on the air. There are two reasons DWAIT is used. The first is to leave a hole in the channel utilization so digipeaters can get a word in edgewise. The second is to add delay so that BBS systems won't grab a disproportionate amount of channel time. DWAIT was discussed in detail in the August issue. DWAIT and TXDELAY are shown in Fig. 2.

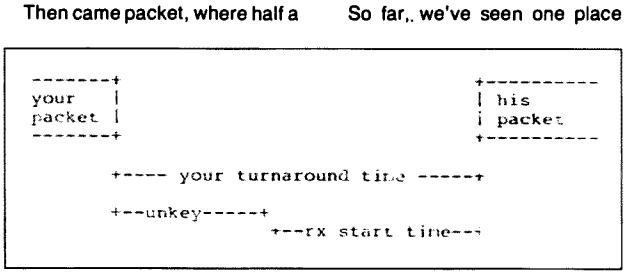


Fig. 1. Turnaround time and packet timing, not to scale.

Figs. 1 and 2 are similar, and, in fact, it is usually the DWAIT parameter at the other station that makes up the extra time that allows your station to get ready to receive another packet. In Fig. 2, the hole left by DWAIT is meant to be filled by the start of a digipeated packet. For best results, DWAIT should be set to the amount of time it takes for the digipeater to key-up—its true TXDELAY value. For BBS stations, DWAIT should be increased.

There are actually a few more complicating factors; one of these days I'll sit down and write a book about it. But for now, this should give you an understanding of some of the non-data speed-related delays in packet.

Is 2400 Twice 1200?

We started this discussion to show why 2400-bps packet is not twice as fast as 1200-bps packet. Armed with the knowledge in the previous section, we can now see why: Data speed is only a part of the total packet time. The effect gained by speeding up the data rate is only proportional to the length of time you are actually sending data. Let's look at the actual time it takes to exchange a packet.

As of the spring of 1986, most of the data on the packet channels comes from store-and-forward message systems. The most popular systems, written by WØRLI and WA7MBL, send out packets based on the length of the line of the message being sent. There seems to be a disagreement on the best number of packets to send out in a single transmission (MAXFRAME); some use one, others two or three. For this discussion, we'll assume that two are sent.

Many stations keep the default

TXDELAY setting of 30. On the TNC-2, this means the length of time to wait for the transmitter to turn on is 300 milliseconds (ms). WB6YMH and I ran a test this afternoon to see how small we could make it. My receiver (an IC-251) has a turnaround time of 220 ms. We determined this by connecting our stations together, and then setting WB6YMH's TXD to 1. I sent a frame, and WB6YMH's TNC station acknowledged it. He increased his TXDELAY until my TNC heard the ack. He had to set TXD to 22 before my station got turned around in time to hear the ack. (By the way, I'd be interested in getting reports on the turnaround time of other radios.)

For the first example, I'll use actual parameters from a local BBS and its user TNCs to show the average improvement to be expected. Assume there are two IC-251s with TXDELAY on a TNC-2 set to 22. The transaction to be measured is two packets containing 72 data characters sent in one transmission, and an ack frame sent in a second transmission. DWAIT is 30 on the BBS, and the default is 16 on the user TNC. Length of a single data frame is 576 data bits plus 152 overhead bits—addresses, CRC (Cyclic Redundancy Check), for examples. The ack frame is 144 bits long. The total data sent is 1,600 bits. The total non-data delay is 900 ms. The total transaction time at 1200 bps is 2.23 seconds; at 2400 bps it is 1.57 seconds. Thus, 2400 bps is an improvement of only 1.4X, or 42%.

You can get closer to twice as fast if you are doing a point-to-point bulk file transfer and if you retune your TNC accordingly. Assume a file transfer, with the file sent four frames at a time, 250 bytes per frame. The other parameters remain the same, and the improvement is 1.8X, or 80%.

Note that even if the data rate is increased to 9600 bps, the improvement is only 2.1X, or 110%. So how do we get faster? By decreasing the turnaround time. In discussions with those who know radios, I'm told that 10-ms turnaround times are easy and that 1 ms is obtainable with a little care. Assuming a 10-ms turnaround in the first example with no data rate increase, the transaction time improves 1.65X, or 65%. Then increasing the data rate to 2400 gets an additional 1.98X improvement.

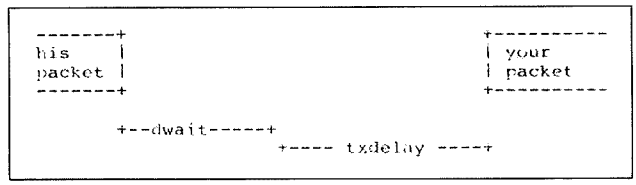

Fig. 2. DWAIT and TXDELAY.

It should now be obvious that what we need are faster *radios*, not just faster modems. There are at least two manufacturers with a project in the works to do just that, i.e., build an rf modem with both a higher data rate and a fast turnaround time. The improvement given by a 9600-baud radio with a 10-ms turnaround time over the 1200-bps, TXDELAY-22 example given above is 11.7X, or more than 1,000%. They may cost more than just adding a TNC to your existing radio, but an 11X improvement is worth the greater cost.

Determining just how much more it's worth will cause the manufacturers some sleepless nights, I'm sure. I saw a prototype of a 4800-baud fast-turnaround rf modem at Dayton, and, as of this writing, hints are being dropped that a 9600-baud rf modem will show up at the San Diego convention in the fall. In the meantime, if you do a lot of point-to-point file transfers, the 80% improvement offered by the current 2400-baud modems in that mode may suit your needs.

An unfortunate side effect of turnaround time and the TXDELAY adjustment is that the turnaround delay of *your* radio should determine the TXDELAY setting of the *other* TNC. There is no standard way of allowing your TNC to suggest a setting to the other TNC. . . yet. Just such a capability came up at the June meeting of the ARRL Ad Hoc Committee on Digital Communications, which is the closest thing we have to an AX.25 standards organization. And that, friends, is the segue into our next topic.

ARRL Digital Committee

Back in my first column, I said the ARRL was doing good things for packet. One is sponsoring and publishing the proceedings of the yearly amateur Networking Conferences, and a second is sponsoring the Digital Committee. This group meets at least twice a year (and has just had its June meeting) to discuss technical issues and to handle various sociopolitical problems that the local League members and offshore Leagues bring up. Officially, the committee is an advisory group to the ARRL board to help the ARRL make decisions on what it wants to do in packet matters. It also has become the semiofficial AX.25 standards committee. Anyone may attend these meetings; one of them each year is held at the Networking Conference.

I'm out of room for this month as it is, so I can only mention a few of the topics discussed. (I'll talk about some of them in detail at a later date.) The major topics were:

•HF frequency utilization. Much concern over the use of HF message-forwarding frequencies and congestion has been expressed to ARRL board members, and they passed it down to us. We gathered information and listed the issues and concerns, and are currently waiting for input from a group of five "Big Gun" HF BBS stations before making final recommendations.

•Automatic operation on HF. The ARRL board executive committee wanted to do a limited test of unattended HF packet with 15 stations participating. The Digital Committee, again consulting the HF BBS community, determined that 15 stations were too few, and is currently working to get the number of stations increased before an official Special Temporary Authority request is filed with the FCC.

•Changes to AX.25. GLB proposed that AX.25 be modified to allow a TNC to poll another TNC to see if any special, manufacturer-specific features are present, and if so to make use of those features. The committee agreed with the desire to add this capability, but disagreed with the proposed implementation strategy. We determined that a new frame called an XID frame would be more suitable. This frame would be sent before the actual connection was begun, and could be used both to request a list of features from a TNC and to state a list of available features. One use to which this capability could be put would be to announce the turnaround time of the station so that the other TNC could adjust its TXDELAY to an optimum value. New features to AX.25 cannot be added lightly; since there are now (as of June) approximately 18,000 AX.25 TNCs in existence, new features must not cause older TNCs to be unusable. Terry Fox WB4JFI is to work up a specific proposal for circulation to TNC software and hardware users and to the general packet-user community.

•Changes to Part 97. The committee has begun work to define major changes to Part 97 to permit future development of digital technology in the amateur bands. We want to have major agreement throughout the digital community before we submit a proposal to the ARRL board to have them petition the FCC. Look for these preliminary proposals in the short-lead-time publications. I'll be discussing why such steps are necessary in a future column.

•Growth. We discussed the Novice Enhancement proposal made by the ARRL, and while everyone had a minor point or two where a change in the proposal was desired, we all agreed that it was a step in the right direction. We agreed that digital was amateur radio's growth mode right now, and if amateur radio itself is to get back on the growth track, digital would be a major participant. We also tentatively agreed to think about proposing to discuss at some future date the possibility of looking into a limited, entry-level digital license that possibly could contain a clause that might be construed as having the attributes of, er, ahem, er, shall we say, a less than complete set of requirements in the traditional telegraphy sense. Seriously, we want to see if it is possible to define a digital license that the general amateur population will accept. This is not a task we've been set to do by the ARRL, and it may never get to the stage where we'll propose it to the ARRL, but since the term "digital license" keeps popping up in various places, it makes sense that the digital community determine what such a thing might be.

We're way out of space for this month. While I've been working on this column, WB6YMH has been using me as a guinea pig for a binary file transfer program that uses the TNC's transparent mode. It looks good, and we may talk about file transfer here next month. Or, we may have something completely different. You'd better check in and see.■

ATV

Number 14 on your Feedback card

Mike Stone WBØQCD
804 Jefferson Avenue
Lowden IA 52255

It is refreshing to see a respected, leading national amateur radio magazine recruiting contributing editors for regular coverage of specialized mode operations. Yes, WAYNE IS INDEED BACK as his *73* ads have been saying. When Editor Perry Donham KW1O asked me to write a monthly amateur television (ATV) column for them, I was flattered and couldn't turn down the chance to preach to a captive audience on just how much fun amateur television can be in the 80s!

Amateur television really got started unofficially way back in the early 30s when experimenters and commercial employees of RCA, NBC, CBS, and other companies ran first tests on the shocking new visual medium and actually did so under their amateur FCC licenses and callsigns. But it wasn't until the 50s that ATV got going on a bona fide hobby basis, and since then it has continued to grow steadily both in interest and in the number of operators. Today, ATV is one of the most exciting modes available in specialized communications and remains an area that encourages building and real experimentation and, of course, is a whole lot of fun!

First a little background on myself. I have been a licensed amateur for about 12 years now and currently hold a General-class ticket. I have been active from time to time on nearly all HF bands on SSB (including 160), but have of late spent most of my time on VHF/HF RTTY or ASCII, fast- and slow-scan TV, facsimile, and more recently VHF/HF packet radio. I am solely responsible and take total blame for shutting down OSCAR 6 (I think WØRWC and I here in Iowa wore out the solar cell batteries). I spent a few years passing traffic and SSTV in the U.S. Navy/Marine Corps MARS (NNNØAWF).

I'm also the current editor/publisher of *The SPEC-COM Journal* (known as *A5 ATV Magazine* until March, 1985), a relatively small specialty communications periodical (strong on ATV modes) published 10 times per year (see our ad in this issue), and I founded The United States ATV Society (an organized group of ATVers) in January, 1983.

It is my hope that I will be able to enlighten you, the reader, on how simple and easy it is to get "on the ATV airwaves" for a minimal investment. I need to hear from you *73* readers and will try to answer as much mail directly as possible. Have patience on replies and always include an SASE. If you are already active on ATV, send me a photo of yourself and your TV station setup and a bit about yourself and the activity going on around you. Some of this material may also be selectively cross-published in *SPEC-COM* from time to time.

To start, I would like to briefly touch on the different types of ATV, how to get started, how to build or purchase gear and antennas, where you can read more about ATV, and just how much it will cost you to get on the air.

What Is ATV?

Let's talk for a moment about the different types of ATV. Most of the public and many thousands of licensed amateurs are NOT aware that licensed ham radio operators (Technician class and above) can operate full transmit and receive TV stations! Fast-scan television (FSTV)—called fast scan mostly to distinguish it from the type of picture sent on slow-scan TV—uses exactly the same standards as American Commercial NTSC TV, i.e., 525 lines of captured amplitude modulation (AM) video information with black and white or color (depending on the type of camera used), accompanied by a 4.5-MHz FM audio subcarrier that produces the sound that comes out of your TV set. This match to the American Television standard makes conversion to amateur television an ideal, low-cost option because any household TV set can be used to receive ATV! "Live" UHF-TV pictures can be transmitted from any camera over the airwaves from one person's shack to another—sometimes over distances of several hundred miles. VCRs have become quite a popular tool for storing and recording FSTV programming and CQ calling and testing sequences.

Slow-scan TV is the still-frame, slide-show type of image that you have perhaps seen coming from the Voyager spacecraft vehicles where the picture starts painting from the top of the screen and downward in a slow, but steady display pattern. Slow-scan TV signals are really video pictures converted into audio tones sent through your radio's microphone circuit, picked up by the other person's receiver and decoding box, and reconverted into a video picture on the tube again. Since the tones sent and received are in audio form, they can be recorded on any standard audio cassette or reel-type recorder for later replays. The old days of green or yellow P7 image-storing tubes and blurry, fading pictures are long gone and have been replaced by quality, high-resolution b/w or full color images.

Unlike fast-scan TV, which is limited to local area ground-wave propagation, SSTV can travel thousands of miles—from California to South Africa and back again—on the HF bands, all in just a few seconds of transmission time! (A General license and above is required at this time.) 14.230 MHz on the 20-meter band and 28.680 MHz on the 10-meter band are the two most used "hot spots" for this type of activity.

Tune in on your HF receiver at just about any time of day or night and listen for the operators

Photo A. Hi, from Mike WBØQCD.

Photo B. Dave Guthrie (formerly 5NØDOG) operating RTTY/SSB/SSTV from Lagos, Nigeria, in March, 1980.

talking about their video pictures and SSTV gear. Most SSTV operators will stay in one small frequency area of operation so their shrill tones won't annoy others nearby not interested in the fascinating TV picture mode. A good time to catch these fellas and gals is on a Saturday, late in the morning and in the early afternoon (1800 UTC) on 14.230 MHz as they check into established SSTV nets conducted by Brooks Kendall W1JKF and Don Miller W9NTP. They have a lot of fun "relaying" each other's pictures from one part of the country to the other for all to see!

One other form of ATV that is gaining popularity is similar in standards to SSTV, but is usually classed in a separate category. I am speaking now of facsimile TV. FAX for many years was a paper-printing picture and information mode only. But now, with today's technology, it, too, has worked its way into small IC chips and color video monitors.

While all three forms of ATV have been crossed in transmissions, FSTV and SSTV are generally thought of as true ATV. The slower, but more interesting FAX mode of visual communications is now being covered in Dr. Ralph E. Taggart WB8DQT's column, WEATHERSAT, beginning with this issue. Any mention of the FAX mode in MY future columns will be of a very limited basis. Check out Ralph's column for the latest in what's happening on that medium.

Which Mode Should I Get Into?

Which type of ATV is right for you? Maybe you would like to try them all but want to take on only one at a time. Perhaps asking yourself a few basic questions about your current interests might help to steer you in the right direction. Do you have patience and do you like to tinker, solder, build, experiment, and operate the VHF/UHF bands more than the HF frequencies? Do you already have a video tape recorder and a camera of some type, or do you really enjoy the challenge that UHF operation demands? Then fast-scan TV is for you.

If you like to work DX, work all states, conduct long, general ragchews, and have a better than average hobby spendable income, then slow-scan TV will be quite enjoyable for you. Both ATV modes can be done cheaply or expensively. I will steer you and give you the choice of both directions in my future columns. For this month's column, I will briefly discuss getting started in fast-scan TV, as it is the newest and most misunderstood mode to most radio amateurs.

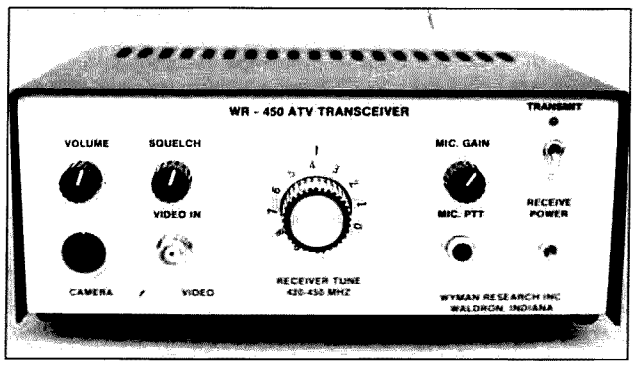

Photo C. Wyman Reseach WR-450 ATV transceiver.

And Now a Brief Word From Our Sponsor

If you are serious about getting started on FSTV, I recommend *SPEC-COM*'s ATV manual, *EVERYTHING YOU ALWAYS WANTED TO KNOW ABOUT ATV *but were afraid to ask*. It is 112 pages and 15 chapters of jam-packed information from the history of television to ATV repeaters, groups, and clubs in the United States. This manual has a lot of money- and time-saving tips, construction diagrams, projects, article references, and commercial advertising that will answer a lot of your questions about ATV. Even SSTVers should have this book. It sells for $9.95 ppd. Write for Book #100 to the address at the end of the next paragraph.

While I have the store open, any of you who would like to receive a "free" sample issue of *SPEC-COM*, just send $1 to help offset the postage and I will put a recent issue in the mail to you along with subscription information (see our ad in this issue). Order the above book, and I'll include the issue in the same envelope and pay the postage for you (you must ask for the sample issue to be included). Both items are published and available from The SPEC-COM Communications Group, PO Box H-73, Lowden IA 52255. End of commercial.

Back To Our Movie

The biggest problem in getting on fast-scan TV is finding someone else to see your pictures. Maybe you are lucky and you already live in or near an area that has ATV going. Most major cities in the United States have some level of UHF ATV activity. Drop me a line with your location, and I will give you the names and callsigns of amateurs around you already operating the mode, what antenna polarization they are operating, and what frequencies they are sending their pictures and talking on. If you are in an area where no ATV activity exists, you have the distinction of becoming a real pioneer! For that, you'll need a buddy to get on the air with. 439.25 MHz is the nationally recognized calling frequency for FSTV operation.

To get started using ATV, you need a small UHF TV-type antenna, some good low-loss coaxial cable, a downconverter, and a good working (preferably state-of-the-art) TV set. That's it! To send ATV pictures and sound, you simply add a transmitter, a microphone, and sound subcarrier generator. A complete low-power ATV transceiver can be purchased "ready to go" for less than $300. If you would like to build it yourself, you can save even more money!

There are several companies here in the United States making quality, low-cost, commercial-type ATV transmitters, receivers, and related equipment. The largest and oldest by far is one owned by Tom W6ORG and Mary Ann O'Hara WB6YSS. Their company is called P.C. Electronics (2522 S. Paxson Lane, Arcadia CA 91006; (818)-447-4565), and they, too, have regular ads in *73*. The basic ATV "receive only" downconverter board that is completely tuned and built (ready for cabinet housing) costs $49 (TVC-2). An 80-mW transmitter runs $89 delivered (a 10-Watt version is $179). A complete 1-Watt PEP "all-featured" FSTV transceiver is offered for $299 (TC-70-1).

In the Midwest, Don W9NTP and Sue Miller W9YL of Wyman Reserach (RR#1 Box 95, Waldron IN 46182; (317)-525-6452) offer similar equipment. Send an SASE for their catalogs. Wyman's line "gives you a choice" and lets you build an ATV rig from scratch with a bare board, supplied parts, and extensive documentation at even greater savings.

Communication Concepts, Inc., (2648 North Aragon Avenue, Dayton OH 45420) has a neat little ATV-1 receive board kit for $34.95. Want to buy your own parts? The board is available for $10, the manual for $5.

TV sets can also be modified to receive channel 13-1/2 ATV signals and, when preamped, can be as sensitive as purchased or built downconverters. Since the TV set is the receiver, most of the expense has been taken out of getting on the visual mode. A lot of ATVers like to home-brew their own small UHF TV antennas, and they work just dandy. KLM and the more popular English-made Jaybeams are used by most for the best performance, especially over long distances. P.C. is a good source for the KLM antennas and John Beanland G3BVU/W1 of Spectrum International (PO Box 1084SC, Concord MA 01742) is the U.S. distributor for Jaybeams.

Good low-loss coaxial cable is essential, such as Saxson's 8285, Belden's 8214, or preferably their better 9913 line. High-power amplifiers of 50, 100, or more Watts can be purchased from Mirage and other sources or home built to extend the operating range of your fast-scan TV signals. It is not uncommon here in the Midwest to work distances of more than 250–500 miles several times in the year during band enhancements. During Field Day weekend, from Iowa, I made two 2-ways with P2 pictures with stations in Cincinnati, Ohio!

Well, gang, I have tried to give you a fast crash course on what ATV is, how to get started, and where to begin to find sources for equipment. Later, I'll go more deeply into the specifics of these modes and how they are being used on the air today, along with a list of ATV groups and repeater systems around the country. Stick with me and *73*, and I will soon have you doing the "nightly news" from your anchor desk. Goodnight, Walter.■

QRP

Number 24 on your Feedback card

Michael Bryce WB8VGE
2225 Mayflower NW
Massillon OH 44646

I guess that I should get several things out in the open. Number one, I don't want anyone to think that I'm out to lower the power limit on the amateur bands. I like the idea of telling a newcomer in my shack that I can run up to 1.5 kilowatts PEP output. When I try to explain to that new Novice that he can work the world on a "Watt or two," he looks at me as if I'm not wrapped too tight.

If you enjoy running an amplifier, hey, that's fine with me! In fact, if it were not for the QRO (high-power guys) on the other end, life would be very dull for me. There are times when "the other guy's" skill, patience, and expertise make all the difference in making the low-powered QSO work. If that still makes you upset, then I guess you can join the "Hate Mike Bryce Club." Send all requests to my wife, Lynnette, president of the club, or to vice-president Terry Russ N8ATZ. It should be noted that Terry is under a six-month suspension for buying me a Coke at a hamfest. I run QRP because I *like* to, not because I must.

I imagine there are several different types of people who will read this column. Number one would be those interested in QRP operation. Second, those who heard about it and would like more dope on the subject. Third, the guy who's curious about different hobbies within amateur radio. And finally, the guy who grabs this issue on the way to the men's room. I hope to include something for everyone.

QRP

I'm not one to break tradition, so we might as well start at the beginning. Just what is this QRP stuff anyway? I'm sure you have all heard about it before, but may not know exactly what it's all about. Well, operating QRP means running low power. So the first question is: "How much power is QRP anyway?" That's like my three-year-old son asking, "How high is up?" The answer to both questions depends on whom you talk to or what you read.

The international Q signal shows QRP as "decrease power," but does not say decrease to what. Placing a "?" after the Q signal asks the question, "Shall I decrease power?" I doubt that very many of us hear that one on the air! The FCC has a regulation on the books, Part 97.67, that goes like this: "Notwithstanding the provisions of paragraph (a) of this section, amateur stations shall use the minimum amount of transmitter power necessary to carry out the desired communications."

Hmmm, sounds kind of open to me. In real life it's not followed too much. As an example, let's say you're running a kilowatt on 20-meter SSB. If you reduce your power to 400 Watts and still are S9 on the other end, you can say you're QRP. I don't think 400 Watts is QRP, do you? But what if you're running 10 Watts and are S9—you're still illegal until you reduce power to, say, 2 Watts. So the answer to the question? Well, the term QRP is relative. I would be QRO at 20 Watts if you're running 5 Watts, and you'll be QRO to someone running 900 mW.

"If you're running 10 Watts and are S9 you're still illegal until you reduce power to, say, 2 Watts."

Even the ARRL is gray in this area. For example, the League defines QRP as 10 Watts input, 5 Watts output, but does not recognize power levels under 1 Watt as being very, very low power. (In some circles, it's known as QRPp; to others, milliwatting.) As for me, I consider anything under 5 Watts *output* as QRP—no matter what the input power is. This is also the power limit defined by the QRP ARCI (more about them in a later column).

I hope that brings a better understanding to you about QRP power levels. Now if you're up to it, give low-power operation a try. Every radio ever made, home-brew or store-bought, can be used on QRP. Every one that I have ever seen had either a drive-level control or an rf-out level adjustment. By placing an in-line wattmeter between the antennna and the transmitter and by reducing the drive or rf level, you can put the output power anywhere you want. If this is your first attempt, try running about 20 or so Watts output. This will ensure a good number of contacts and start your blood moving. Keep reducing your rf power to 2 or 3 Watts, and then start enjoying the true sport of QRP!

After a while, you may notice it does not make much sense to run a 100-Watt radio throttled down to 2 Watts. There are what I guess you can call QRP transceivers on the market. Without a doubt, Ten-Tec's famous "Argonaut" series transceivers are world-class. The Argonaut's big brother, the Argosy, sports a low-power position switch for power output of less than 5 Watts. Hardly a red-blooded QRPer has ever been born who has not at least operated one of these radios. Ten-Tec also sold the Century 21, a high-powered QRP transceiver if you will. The Century runs about 35 Watts output, and can be reduced in output via a front-panel control. The Century 21 was discontinued a few years ago, and the Century 22 took its place. It also runs about 30 Watts output and sports a variable rf drive control.

Next in line comes the Heath HW series. Heath sold about 10,000 HW-7s and somewhere in the neighborhood of 15,000 HW-8s before they were taken off the market. Heath's new HW-9 is selling very well. While the HW-7 was a bit of a dog, the HW-8 remains a very strong QRP contender. There are many other makers of transmitters/receivers and transceivers. Some are now history, and others are very new to the marketplace.

There is one more way to get on the air without the need of lighting off that big rig. You can try your hand at building a transmitter of your own. There are some very simple one- or two-transistor transmitters out there, but I would recommend that you first get your feet wet by working a few stations with the QRO transceiver at reduced power. There have been reams of paper consumed describing different transmitters to build. You will never know the satisfaction of making contacts with something you have built with your own hands until you try. It's not that hard, and it's a lot of fun!

No matter what amount of power you're used to running, the antenna makes the difference between an empty log book and a mailbox full of QSL cards. Even more than ever, a good antenna system is a must. It pays to use the best. Put a good dipole up high and in the clear. Use some type of gain antenna on 20, 15, and 10 meters. Monitor the propagation. Use the propagation as a tool. Listen to the bands. If someone is running a kW on 40 meters in Ohio and he is only S3, with you in New York, then you may as well go watch reruns of "Star Trek" as to try QRP that night.

If you have yourself all geared-up and ready to go, where do you look to find some good QRP action? Depends on the bands, but listen for low-power stations on 80 meters at 3.560 and 3.540 MHz. On 40 meters at 7.040, 7.030, and 7.060 MHz. On 20 meters at 14.060 MHz. On 15 meters at 21.060 MHz. And finally on 10 meters at 28.060 MHz. What's this, you're not into CW? Then try SSB on 80 meters at 3.985 MHz, 40 meters at 7.285 MHz, 20 meters at 14.285 MHz, 15 meters at 21.385 MHz, and 10 meters at 28.885 MHz.

On the Hook

Next time, who knows? Perhaps some contesting with low power. If you like the column, then please tear out the Feedback card and send it in. Wayne Green reads these columns at night, so I hope that he gets to mine before his warm milk and cookies. I know he would like to hear from you about how I'm doing. And secondly, I need the money! So drop the 22 cents for a good cause. I would also like to hear from you, the readers, about what you would like to see, or not to see, here in the QRP column. I have a big mailbox and a friendly mailman (mailperson?), so drop me a card or letter, and we'll see what happens.■

NEITHER SNOW, NOR RAIN. . .

The column this month is dedicated to our local letter carrier, who is recovering from injuries suffered while bringing me the last (heavy) bag of fan mail. I shall try to wade through as much of this as I can this month.

John Gunsett KI4VP of Manassas, Virginia, asks whatever happened to Macrotronics, Inc., of Turlock, California, which manufactured the Terminall unit. He has upgraded his computer setup from a TRS-80 Model I to a Model 4 in the Model III mode, and would like to upgrade the Terminall unit as well. Well, John, I have no information on that company. The only thing in the files for the TRS-80 Model I/III/4 is a program written by Clifton J. Turner, Jr. WB5KCQ in Alexandria, Louisiana, which several amateurs have found comprehensive. Does anyone out there know about Macrotronics? Let me know, and I will pass along the information to the masses.

Greetings to Robert Davis, of Gillette, Wyoming, another of our loyal readers. I hope the information sent out is of use. Kenji Sugimoto JG1GWL/KE6QX in Setagaya, Tokyo, Japan, also sends along his regards. I hope to hear you on RTTY soon, too, Ken. Ditto to Gary Allen, of Mt. Carmel, Tennessee, and Nathan Leichty, of Grand Rapids, Michigan.

Serge Cuvilly HH2C of Port Au Prince, Haiti, would like to interface a recently purchased HAL DS-3000 KSR terminal with an Epson RX-80 printer for a hard copy. Well, Serge, I do not have any information on the DS-3000, but if it has an RS-232 modem connector as does the DS-3100, you may be able to use that serial output to feed the printer, assuming your printer has a serial interface. Anyone out there done this one yet? Let me know, and I'll print what I can find out to help us all.

All of the comments about stray rf, going one way or another within the ham shack, prompted a response from J. Fred Bergsma VE3CLS of Stratford, Ontario. Fred relates that, rather than having problems with rf in the shack exciting his computer, he seems to have more problems with rf from the computer bothering the HF and VHF equipment. The VHF antenna, he states, is in close proximity to the computer, which accounts for a large part of the interference—although he believes that a more typical installation might still be affected.

Fred lives in an apartment, and is having his share of problems installing a good ground system. Nonetheless, he feels that his computer, an IBM PC, would make a good RTTY station, if only he could solve this one problem.

Well, Fred, if you are able to obtain enough of a ground for the ham station to work, I doubt if that is the source of the problem. Having the VHF antenna near the computer certainly may be a problem, though, as radiated rf, originating in the computer, may be picked up by the antenna, partially rectified (detected) by the VHF radio, and re-radiated to create spurious signals all over the spectrum.

Depending on just what kind of computer you are running—IBM brand, other brand, or brandless clone—shielding within the computer cabinet may be adequate, borderline, or nonexistent—not necessarily in that order! If you can shield the box and any cables running outside of the main unit, this may help as well. Keep plugging along, and let me know how things interface.

Speaking of interfacing (sorry), Gary G. Flechtner WB8HLI of Tiffin, Ohio, has a Commodore Plus/4 computer that he would like to put onto RTTY. He states that his queries to several Commodore Users Groups, as well as inquiries to other magazines, have been fruitless. Surely one of our readership must have a solution for Gary's problem, no? Drop me a line, and I will print the information for all to benefit!

Russ Butterworth WA6TJS of Corona del Mar, California, has just acquired an Apple //c, with an added CP/M card, and all the accessories, and would like to get onto amateur RTTY, as well as receive weather and news on CW, receive and possibly send TELEX via European commercial stations, and get onto packet radio. He wonders just what is needed to accomplish at least all of this.

Well, to begin with, amateur RTTY is easy. Just use any of the RTTY programs we have covered here in the past. Well, kind of easy. You see, most, if not all, of these have been directed at the Apple][or Apple //e computers. A few months ago we dealt with the difficulties of interfacing the Apple //c on RTTY given its apparent lack of game ports or the like. I have received no answers on this one, and this reported difficulty may influence the rest of your task.

So, while there have been many programs published to run CW on Apples of various species, I am at a loss for interfacing the //c at this point in time. Packet is not so much of a problem, however, as this normally requires an ASCII terminal program of sorts, with an external terminal node controller, which itself contains most of the "smarts." I hope more will be available for the Apple //c, and don't doubt that it will. As it becomes available, where else do you think you will see it, but right here?

Up in Winchester, Massachusetts, Bob Thompson N1CIH is trying to put his TRS-80 Model I onto RTTY. Among other things, he has looked in vain for the function generator detailed here a few months back in the "single-chip RTTY" circuits. Well, Bob, although Radio Shack has omitted these chips from their current catalog, a look around at a few other parts suppliers (they advertise widely) will turn up the XR-2206 and other chips to boot. You may even find them on the wall of a local parts emporium, safely encased in plastic bubbles.

The information presented on the Model 100 touched a responsive chord in Lou Graue K8TT of Bowling Green, Ohio. Lou has written several RTTY programs, and offers a possible solution to the Label Line question on the Model 100 program.

Adding the following line to the program will label the keys:

```
176 KEY1,"60WM":KEY2,
"66WM":KEY3,"75WM":KEY4,"
100":KEY5,"T - R":KEY6,"
NL":KEY7,"LPRT"
```

In order to return to default, line 300 should be changed to read:

```
300 CALL 23164,0,23366:CALL
27795:MENU
```

And, if you want the label line to come up at the beginning, add the line:

```
177 CALL 17064
```

Lou adds that you cannot toggle the label line while in "receive" but you can while in "transmit." Thanks for the help, Lou. I am sure that the many Model 100 users thank you as well.

Can anyone help Agust Bjarnason TF3OM from Iceland? He is only one of many users of Macintosh computers that yearn for the thrills only RTTY can deliver. So far, none of my feelers for a MacRTTY program have been answered. I somehow can't believe that at least a couple of dozen hams aren't running a Mac on RTTY—am I that misguided?

Yes, that fabled list of reprints is still around, and remains available for a little old self-addressed, stamped envelope. For those of you who may have come in late, this list is a recap and revision of some of the material in earlier years of this column. Feel free to ask for the list; you just may see something that interests you.

I continue to hang out on several national BBSs, as well, as time and expense permit. E-mail addressed to user number 75036,2501 on CompuServe or to MARCWA3AJR on Delphi stands a better than even chance of reaching me. I try to reply to E-mail as soon as possible after I receive it; certainly faster than written mail. After all, I am already at the terminal when I receive it! Anyway, letters are, of course, welcome. Enclose that self-addressed, stamped envelope with those letter questions if you desire a personal response, as well.

And now, a tease. For several months, I have been hearing from owners of TRS-80 Color Computers that what they are looking for is a disk-based RTTY program, with full features. As I write this last paragraph, guess what just showed up here at the station? Let me look this over and play with it for awhile. The result should hold a great big find for CoCoNuts in a future column. Don't worry, I won't forget the rest of you. How could I? You tell me that *73*'s most read pages are right here—in RTTY Loop!■

DON'T TELL A MAN NOT TO DREAM

If Milt Jensen N5IA had not believed that dreams could be made into reality, the Zia Connection would never have been born. What is the Zia Connection, you ask? It's many things.

Technically speaking, it is simply a bunch of repeaters that have been interconnected to let hams in one town talk to hams in another and to those on the road in between. Obviously, there are some who look at the Zia Connection as a marvel of modern technology. It can be seen as proof that open, wide-area, intercommunity repeater linking on a full-time basis can be accomplished even over long distances. Most important, though, it proves that amateurs involved in VHF FM need not be shackled in their communications abilities by the designated coverage of their favorite repeater: Through cooperative effort it is possible, as the telephone company has said for years, to reach out and touch someone. The Zia Connection is all this and a lot more.

For those of you who have not guessed by now, the Zia Connection is a wide-area, open, interconnected repeater network. To be more specific, it covers an area that stretches a shade under 1,000 miles across the southwestern United States. The actual east-to-west distance is about 600 miles, but that does not count some of the north-south tributaries that have been built into the system to serve communities like Tucson, Arizona; Albuquerque, New Mexico; and El Paso, Texas. To say that the Zia Connection is the world's largest open repeater is not to make an overstatement. One must either use the system or view a map of it to understand its vastness. In a magazine we can bring you the latter: See Fig. 1.

Unlike other linking systems that limit access to a select few or that stringently control overall utilization, the Zia Connection is a totally open, interconnected system available to any licensed amateur wishing to use it, on a 24-hour-a-day basis. The only times that portions of the system are not available to all users are when technical difficulties arise or when some local disaster situation takes precedence. Thankfully, these instances are few and far between.

Using the system is no different from using any system. It operates in full-duplex mode, which means that signals go both ways over the link at the same time, not unlike a conventional telephone. Operationally, this is very desirable as it allows instant break-in. It also prevents doubling with another station when users have the capability to operate their own stations in the full-duplex mode, as well. In most cases this means having a pair of radios on separate antennas—one talking on a Zia Connection repeater input and the other on that system's output. Full duplex is not necessary, but it does tend to make operating sessions very pleasant for those using the system.

According to N5IA, working stations through the Zia Connection is no different from working them through a single repeater. Each repeater in the system has its own timeout setting, but all repeaters are matched as closely as possible. This way if you time out one of the local ports, you do not cause the entire interconnected system to crash. It remains up and running; only you go away until the timer reset occurs. This is accomplished by not timing the link transmitters to the local repeaters or vice versa.

The only identifier heard when using the Zia Connection is that of the local repeater port. The automatic IDs of the link transmitters are notched out and not repeated on the talk-around or talk-back. When you drop your carrier after a transmission, most ports will "Courtesy Beep Tone" after about a one-second delay. This is a reminder to allow time for other stations to break in, as they would on a local-area system.

The drop-out time from one end of the system to the other is in the order of 200 milliseconds, so it is almost impossible to tell which repeater is inputting to the system. Unlike other interconnected repeater systems, you will never hear a series of squelch tails after you unkey. The same is true on key-up. The pickup time is about 300 milliseconds for the overall system, and Milt suggests that you make it a habit to wait for about a half-second after keying your transmitter before you start talking.

Most of the repeaters within the Zia Connection (see list in Table 1) are privately owned and funded. It is a tribute to the small group of people who dreamed it up that a system of this magnitude has developed a wide enough following to exist with purely voluntary support. Obviously, the setup initially involved a tremendous outlay of capital, and thereafter its operation involved considerable expense (site rental fees, power, equipment maintenance) and effort—laborious trips up the sides

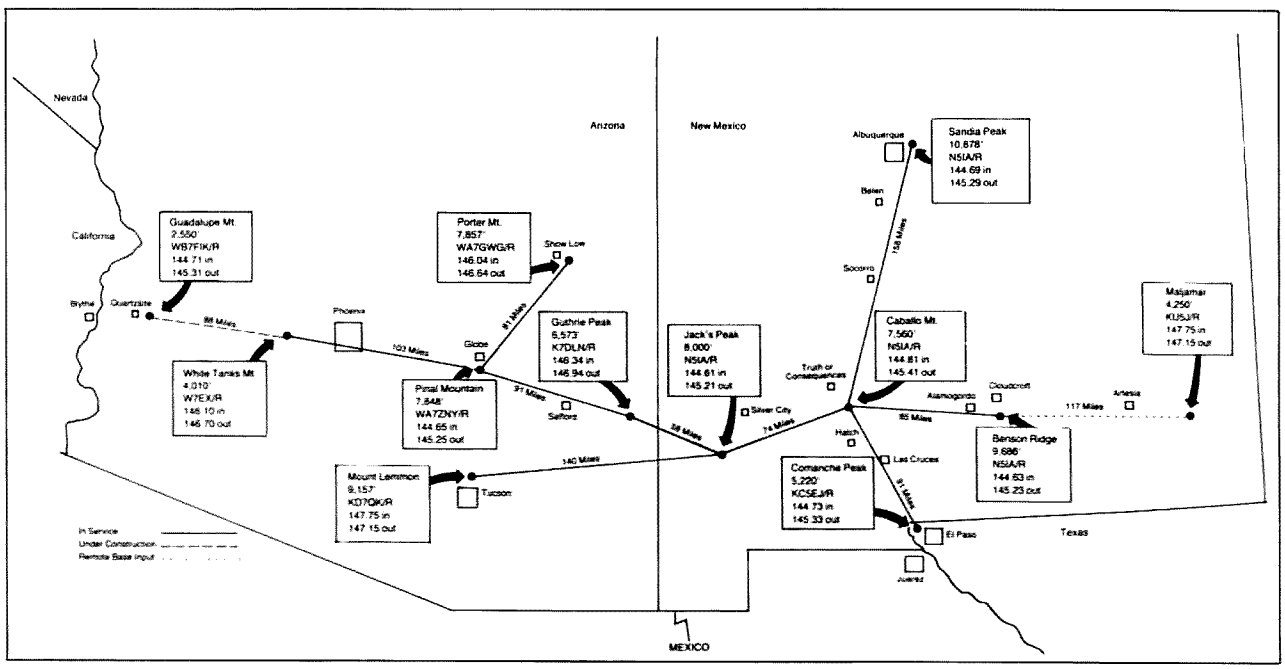

Fig. 1. The Zia Connection repeater system.

of multi-kilofoot mountains, for example.

It exists because it provides a service that nothing else could, not even a 75-meter SSB point-to-point system. The Zia Connection is a living monument to the greatness that we amateurs can achieve. Amateurs involved in VHF FM repeater operations need not have their entire world revolve around the 50-mile radius of a local repeater. Rather, horizons can be expanded: With a simple $200 HT, you can communicate a good part of the way across the continent.

For more information about the Zia Connection, send an SASE to Milt Jensen N5IA, Rte. 1 Box 156, Duncan AZ 85534.

The Super Councils Are Coming, the Super Councils Are Coming

Do the names Mid-America Repeater Council, Southeastern Repeater Association, or Tri-State Amateur Repeater Council mean anything to you? If you are involved in repeater frequency coordination, they may. But if you are just an average Joe Ham, these names probably mean very little. You should know about them anyway, because their very existence can and will eventually have an effect on your day-to-day, on-the-air operation. You see, these are the first three "Repeater Super Councils." They are voluntary coordination groups that have stepped beyond the boundaries of a given state or local area to become recognized regional leaders. In my view, they are the vanguard of things to come.

By far the largest and most successful of the Super Councils is the CVRA-SERA (the Carolina Virginia Repeater Association-South Eastern Repeater Association). Started 15 years ago to handle the emerging repeater coordination needs of the states of North Carolina, South Carolina, and Virginia, the organization never had any intention of expanding. However, as time progressed, amateurs in adjoining states watched the way the CVRA-SERA handled coordination, emphasizing technical excellence rather than politics. Pleased with what they saw, one after another of the neighboring states petitioned CVRA-SERA for membership. As a result, today the SERA oversees coordination of more than 1,200 repeaters in seven states. They do this through autonomously elected Area Directors and Area Vice Directors, who represent the will of the majority of a given state.

The SERA itself serves mainly as an umbrella organization, setting technical standards and band plans, settling inter-area disputes, and publishing what I can only consider the very best of newsletters put out by a repeater council. Did I say "newsletter"? Magazine would be a better term, since four times a year that's exactly what the SERA mails out to its members and other interested parties. Their May, 1986, issue was 50 pages and semi-hard-covered. Topics included lightning protection, the possible effect Novice enhancement will have on repeater operation, and a lot of information on the happenings within the organization itself. It also has paid advertising from some of the top names in the amateur supply industry, as well as numerous major amateur conventions. It's a magazine that rivals the "big four" in both quality and appearance. Not bad for what amounts to a small group of volunteers. In fact, the CVRA-SERA is doing such a good job that they now have become the standard of excellence to emulate.

In addition to the Carolinas and Virginia, the organization also oversees coordination matters in West Virginia, Kentucky, Georgia, and Tennessee. Alabama has petitioned the CVRA-SERA to become its 8th district. Not wanting to be accused of plundering the domain of another regional coordination group, however, the CVRA-SERA has wisely placed that application on hold until the political climate in Alabama is more favorable. With tempers flaring between pro-15-kHz and pro-20-kHz factions, the CVRA-SERA does not feel it should get involved in the political unrest of that area. They can only be successful if they have 100% support, and right now that is impossible in Alabama.

Another coordinating group that had no intention of ever becoming a Super Council is TSARC, the Tri-State Repeater Council in the Northeast. They came into being a few years after the old Northeast Repeater Association died, and took on the task of bringing order onto 2 meters. This task was accomplished in the late 70s under very able leadership. It wasn't easy since several years had elapsed between the time that NERA went bye-bye and when TSARC appeared.

In the early 80s, with Steve Mendelsohn WA2DHF (now ARRL Hudson Division Vice Director) at their helm, TSARC turned its attention to developing other bands and providing protected spectrum for emerging modes including packet radio. In fact, they were among the first to recognize that packet might well be the boom of the 80s and 90s, as FM repeaters had been the boom of the late 60s and 70s.

TSARC was also the first repeater council to recognize that continued viability in repeater operation meant that rules were needed to ensure orderly growth. The repeater deregulation of the mid-70s had brought with it a wild and uncontrolled expansion in the number of systems coming onto the air, many of which served no other purpose than the owner's ego fulfillment. The result of TSARC's interest in solving the uncontrolled growth problem manifested itself in their supplying much of the input utilized by the FCC in its formulation of the proposals contained in P.R. Docket 85-22, also known as the Repeater Rules Rewrite of 1985–1986. (See the July, 1986, Looking West for more details on this regulatory change.)

While the CVRA-SERA has become a Super Council for reasons of geographic representation, TSARC has attained this position based on its abilities in the political arena. They had some minor geographic expansion when the northern tier of Connecticut decided to break away from having their coordination handled by the New England Spectrum Management Association, and opted for TSARC.

Currently, TSARC represents almost 1,000 repeaters operating in the southern portion of New York state, including New York City and Long Island, plus all of New Jersey and Connecticut. Like the CVRA-SERA, they have no eye toward expanding their sphere of influence past these borders, but as with CVRA-SERA, the Tri-State organization is more than willing to lend its expertise to its neighbors if they seek assistance.

Making Use of Repeaters

Our final story this month is about the way FM and repeaters can be used in time of emergency. It's a hard-news story, so I am going to abruptly change my writing style to that used by the Associated Press and United Press International. It's also the "style" used in my *Westlink Report* newsletter, which is where I gleaned this story from.

Amateur radio proved to be the key element in coordinating a five-day firefighting effort and the largest mass evacuation in the history of the United States. This occurred after a freight train derailed near the city of Miamisburg, Ohio, on Tuesday evening, July 8. Miamisburg is located about 25 miles south of Dayton, Ohio, and is the home of the famed former amateur-radio equipment manufacturer, R. L. Drake. The derailment caused a tanker car filled with white phosphorus to rupture. The phosphorus ignited when it came into contact with air, and the ensuing fire formed a toxic cloud that engulfed Miamisburg and an area about 40 miles in circumference.

According to Area District Emergency Coordinator Ron Moorfield W8ICL, amateur radio was called upon to provide common communications channels to all emergency services coming in-

to the area. As has been the case in other incidents in other areas, in Miamisburg, when police and fire crews arrived from other cities, they were not equipped with radio gear capable of communicating on the frequencies assigned to the emergency services in the Miamisburg area. As soon as it was realized that only amateur radio could quickly provide a common radio communications link with Central Dispatch, some 250 area hams were contacted and pressed into service as emergency-service communicators under the area ARES plan.

Working in around-the-clock shifts, amateurs equipped with 2-meter VHF-FM mobile and handheld gear were assigned to ride in all police cruisers and maintain contact to a station at the Miamisburg Central Dispatch office. Other amateurs were stationed at local hospitals and command posts and were assigned to various officials, including Ohio Governor Celleste. In addition, amateurs funneled information between the local weather bureau and the Environmental Protection Agency, which required weather updates every 15 minutes.

Most communication took place using the MOUND Amateur Radio Club's repeaters operating on 147.195 MHz and 145.33 MHz. In addition, a direct link between the on-site Emergency Command Post and the state's Disaster Service Agency in Columbus was established on 145.11 MHz, with amateurs posted at both ends to handle a constant flow of emergency-related traffic.

Moorefield said that due credit should be given to the MOUND Amateur Radio Club, as well as to hams representing approximately 20 different radio clubs that took part in this emergency communications activity. Some operators came from as far away as Cincinnati and Columbus. At any given time, between 90 and 100 hams were on duty, running shifts from 7 to 10 hours, depending on a given activity.

At the height of the crisis on Wednesday evening, the amateurs assisted the police and emergency-service personnel in the evacuation of 50,000 people from the cities of Miamisburg, West Carrollton, Marine City, and sections of Jefferson Township, after it was determined that the toxic smoke from the fire was a definite hazard to public health. About 15,000 of the evacuees were cared for by the Red Cross at evacuation centers, and again it was amateur radio that provided communications between Red Cross headquarters and the shelters.

The fire was finally brought under control early on Saturday, July 10. "We have a lot of tired amateurs," Moorefield told *Westlink Report*, "but they did a fabulous job. They were there on duty, and I can't tell you the praise I have for the cooperation we had between all the amateur radio clubs."

Moorefield noted that in addition to the normal emergency-service communications channels and amateur radio, the only other type of communication was the use of several cellular telephones by the Environmental Protection Agency. Not in evidence, at least to Moorefield, were any 11-meter CB, REACT, or GMRS-equipped groups. This was one of those very rare times when amateur radio was more than just the conveyor of messages. Our service, its members, and the repeaters that they built became a very important part of a gigantic public-service humanitarian effort.

And that's quite a lot for this month from those of us who write the late shift here in Los Angeles.■

WEATHERSAT

Number 29 on your Feedback card

Dr. Ralph E. Taggart WB8DOT
602 S. Jefferson
Mason MI 48854

Welcome to WEATHERSAT, one of *73*'s newest columns, devoted entirely to the subject of weather satellite activities. Most of you are aware of those high-tech "eyes in the sky," if only through the medium of your evening news. What most people are not aware of is the extent of the contribution of "amateurs"—the condescending title initially tagged on experimenters by the professional satellite establishment—in developing low-cost options for the reception and display of weather satellite images!

When the first weather satellites arced into orbit in the early 60s, a weather satellite ground station was an expensive operation that required significant government input. If you had suggested at that time that any school classroom or individual hobbyist could put together an effective station for about the cost of a color TV set, the "experts" would have laughed you all the way to the mental hospital. What they didn't appreciate, of course, was the drive and ingenuity of a host of people with an interest in weather, electronics, or simply the desire to see the Earth from "out there."

Operational weather satellite programs were hardly "off the ground" when Anderson, in a classic article in a 1965 issue of *QST*, showed anyone who was interested how to put together a workable receiver and picture display system. That article launched the "amateur" weather satellite movement and, as years went by and the satellites became more sophisticated, amateur experimentation continued, using the steady advances in electronic technology to more than keep pace with the satellite systems themselves. The result is that there are thousands of small satellite stations out there, displaying pictures from both polar-orbit and geostationary spacecraft.

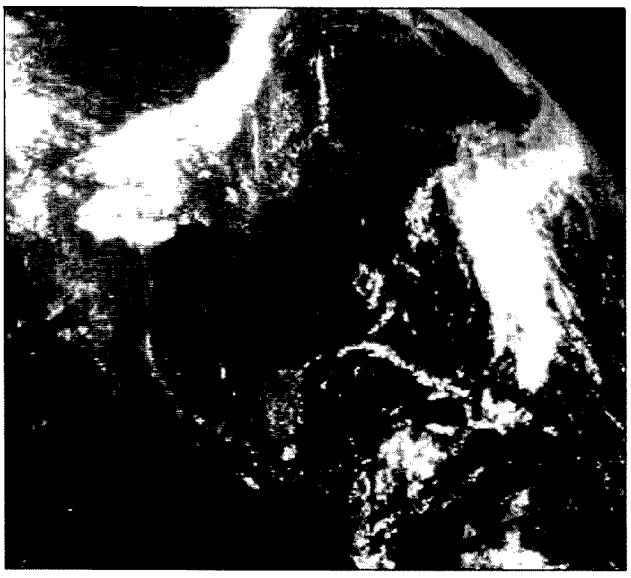

Photo A. NE WEFAX quadrant, imaged by the GOES E geostationary spacecraft and relayed by GOES Central, covering most of the U.S. and Mexico and part of Central America.

In the beginning, all of these satellites were "made in the U.S.A.," but they proved so valuable a tool in forecasting and the development of predictive models that other nations began to orbit their own meteorological spacecraft. The European space organization now operates its METEOSAT spacecraft in geostationary orbit over Africa, and the Soviet Union has a very effective system of operational polar-orbit spacecraft.

No matter where you are in the world, you can have the opportunity to view your region from space four or more times each day. If you are within range of one of the several geostationary spacecraft—and that includes almost everyone in North America, South America, Western Europe, and Africa—you have access to more than 100 pictures per day, covering your own region, with lots of material from elsewhere in the world as well. It will be one of the tasks of WEATHERSAT to keep you informed about all of this action!

It is quite appropriate that *73* should be carrying this column, for this magazine has probably published more articles on weather satellites and facsimile technology than any other major publication in the world. This tradition will continue, but a column like WEATHERSAT provides the opportunity for continuity in coverage that you simply cannot have

with individual articles treating specific subjects or projects.

The challenge in running a column of this type is great, due to the breadth of the subject and the wide range of experience in the potential audience. Even the simplest weather satellite station incorporates VHF or microwave antennas, low-noise VHF receivers (with or without a microwave downconverter), and picture display equipment that may run the gamut from simple CRT display terminals through electronic/mechanical facsimile recorders to stand-alone or computer-assisted scan converters. Some involvement with computers, if only to assist in tracking, is inevitable, and that involvement can become quite extensive (although not necessarily expensive) in the case of more advanced projects.

The audience, of course, ranges from beginner to experienced experimenter, but labels like "beginner" can be misleading. Some beginners are competent radio amateurs with a good background in antennas, receivers, and other aspects of electronics. The problem faced by these people is quite different from that faced by individuals starting from scratch in all aspects of the hobby.

Input by Me and Thee

Can a column like WEATHERSAT cover all this territory? If by "cover" you mean an exhaustive treatment of everything, the answer is a simple NO! On the other hand, it is possible to serve as a useful source of information on the satellite systems, new techniques, commercial equipment, and a basic analysis of different areas of importance in setting up and operating a satellite system.

I know my way around this hobby, but in running a column of this sort it is essential that I get connected with every possible source of relevant information. I am taking steps to ensure that I stay current from the governmental end, but it is also necessary to keep in touch with the people who are doing interesting and innovative things—essentially the more experienced end of the reader spectrum.

If you have worked up an interesting weather satellite project, consider doing a full-fledged article—*73* would certainly be interested, as would other publications. The important thing is to get it out so that others can use the information. If the project, idea, tidbit, or whatever is less extensive, then pass it along and I will see that it surfaces in WEATHERSAT. I can accomplish a lot with the column using my own resources, but I can do even better with the active cooperation of other experimenters.

When you are first getting started (and even later), you may come up with questions that just don't seem to be treated in anything you have read. Others may have similar questions. Pass such questions along and I'll make an effort to regularly treat them in the column. For some, I may not have all the answers, but we will get the problem into print and pass along contributions from the readership in later issues.

News Items

One thing that must be kept in mind is the reality of deadlines in the mad world of publications. Some of the things that I would like to do will be limited by such deadlines. This introductory column, for example, was written in July. If you wait for something to happen and then report on it, it will be a bit dated by the time it appears in print. In contrast, should you indulge in a bit of prediction, you may end up looking very current in your coverage or blow it and stand up tall with egg on your face.

Treatment of current "news" items in the weather satellite field is thus obviously limited by deadline considerations. Some of the "news" items must inevitably be a bit dated to the experienced, well-connected satellite station operator, but that person doesn't need the news function that the column will provide. I will include such information for the benefit of those for whom it *will* be news!

Polar-Orbit Predict Data

Orbital prediction data for polar-orbit spacecraft is another area impacted by deadlines. Long-term predictions of satellite passes for spacecraft in relatively low orbits are a complicated business. The complications all involve factors that result in short-term and long-term changes in the geometry of the orbit and its period. Even making allowances for such factors, based on the history of an individual spacecraft, making predictions over a period of several months introduces errors of up to several minutes in equatorial crossing times and of several degrees in the crossing point. These errors are sufficient to make such long-term predictions unsuitable for *precision* tracking, although the information is more than sufficient to know *when* to listen for a particular satellite, particularly if you are using an omnidirectional antenna.

If the predictions went to *73* along with the column manuscript, predict listings would require a three-month projection. The flexibility of the *73* editorial staff permits me to cut this to two months by feeding them figures while the copy is actually in preparation, and this is a big help. We will start by providing monthly data on the U.S. TIROS/NOAA polar orbit spacecraft. If there is sufficient interest *and* someone out there has access to suitably precise orbital data, we might later include some of the Soviet METEOR/COSMOS spacecraft as well.

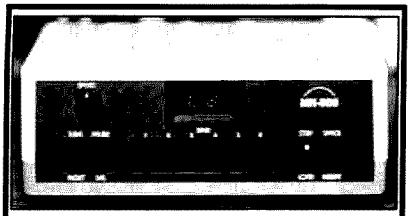
Date	01 October 1986	
Spacecraft	NOAA-6	NOAA-9
Orbit Number	37750	9276
Eq. Crossing Time (UTC)	00:18	00:14
Longitude Asc. Node (Deg. W.)	86	141
Nodal Period (Min.)	101.128	102.085
Frequency (MHz)	137.50	137.62

These orbital parameters are projected two months in advance due to deadline considerations. Accumulated errors due to uncompensated orbital decay and other anomalies result in expectation of errors up to two minutes and possibly as many degrees in terms of the crossing data and possible small changes in the indicated period. Users requiring precision tracking data should rely on more current sources.

Table 1. TIROS/NOAA orbital predict data.

Circuits and Projects

Another aspect of the column will be projects and circuit ideas. Big projects from my end will be handled in articles, but I will regularly include small circuit modules of interest, either of my own design or interesting ideas contributed by readers. Some of these will be fully engineered circuits, while others may be as tenuous as a new idea or approach that has not been fully evaluated. If we can keep everything suitably labeled, you will know whether you are dealing with a simple "cookbook" project or something to tinker with. I have innumerable examples of such little projects, none large enough to justify a complete article, but all of which are interesting and effective. I am sure that some of you have some of the same kinds of tidbits, and WEATHERSAT will provide the opportunity to share them with others (suitably credited, of course!).



Computers

The most obvious application for computers in the area of weather satellites is doing orbital calculations, but this is only the tip of the digital iceberg. Today even the most basic home computers can be used to automate the operation of your station: by recording satellite passes when you are off at work or vacation, by processing imagery in conjunction with an existing display system to enhance contrast or bring out specific details of interest, or by functioning to control a video scan converter to enable a conventional TV set or monitor to display satellite pictures!

Orbital predicts and station control can usually be accomplished in Basic, meaning that the project can be adapted to almost any computer. Image processing and scan conversion, however, require extreme speed, which can be achieved only with certain compiled languages or, more commonly, at the level of machine language or assembly language. These programs are very specific to the microprocessor used in a specific computer and are often machine-specific as well.

There is no way for me to try to instruct you in all of the possible kinds of assembly/machine language programming, but I will, on occasion, treat the *design* of program modules—basically approaches to handling image processing problems that should be applicable in a wide range of situations. Occasionally, I may present specific examples of programming code for the Radio Shack Color Computer or the IBM PC and clones—the latter because they are so universal, and the former because it is so inexpensive yet flexible.

The RC-85 Repeater Controller . . . the affordable controller for any repeater.

The RC-85 controller offers the high tech basics of repeater control. Of course, much of what we consider the "basics" aren't found *anywhere else, at any price*. Remote programming lets you configure the operating characteristics of your repeater, and change them at any time – without a trip to the hill. Non-volatile memory remembers your parameters, even after a power loss.

Synthesized speech makes it easy for users to interact with the repeater. Commands are acknowledged, and information is available to users, through remotely programmable ID, tail, and bulletin board messages. And since your repeater talks, it's friendly and fun to use.

The patch includes ten emergency autodial numbers, and 190 user loadable autodial slots. With toll restrict, "cover tone", and more.

The remote base capability lets you connect a transceiver to your repeater, for remotely commanded linking to other repeaters and simplex channels. With full frequency control! Frequency agile linking is invaluable in public service communications.

There's even more . . . a talking s-meter so users can check how well they're getting into the repeater, a site alarm for security, remote control logic outputs for controlling other equipment at the site.

There's never been a better time to upgrade your repeater system with ACC's products, unmatched in the industry in quality, sophistication, and performance. With well written, illustrated, easy to read manuals, training tapes, and telephone support.

Please call or write now for the rest of the story on all our repeater products, including controllers, digital voice storage units, and other Touch-Tone control products.

You'll be GLAD you did.

information on newly available programs or computer products with weather satellite applications, and I may occasionally be arrogant enough to include review comments. Here is another area where reader input is significant, for, while I am running Color Computers and PCs, I am not about to get one of every possible home or business computer. And if we are to cover products for other systems, your input, along with that of the equipment/software vendors, will be important.

The *Weather Satellite Handbook*

One very significant source of information for weather satellite enthusiasts over the years has been the first two editions of my *Weather Satellite Handbook*. The second edition has been out of print, causing quite a bit of consternation to those who would like a copy. To make a long story short, the *WSH* is back in the form of a third edition. The book has almost 40 more pages than the second edition (the *New Weather Satellite Handbook*), and virtually all the construction projects are in a new, modularized format. Many of the circuit modules are used in more than one project, and even if you choose to rebuild a module for a new project, you are familiar with it and have a working copy to compare with the new one! Computer coverage has been expanded considerably, including a universal PREDICT program in Basic and both theoretical and project treatment of digital scan conversion.

The entire structure of the third edition has been modularized to make it simple to update with the passage of time, and printing runs are kept small to facilitate this. I will continue to shamelessly promote the book for two reasons. First, it is being published by yours truly, and unless I sell some my wife will mutiny and that will be the end of the third and future editions. Second, in all modesty, it has been and is a supremely useful reference for both new and experienced satellite experimenters. It is available directly from me, at the address above, for $12.50 postpaid in the United States and Canada and for $14 elsewhere.

Pictures

In order to communicate some of the excitement of what we do, I intend to include satellite pictures in the column on a regular basis. For the first few columns, any of these will naturally be from my own files, but submissions from readers are encouraged. Such pictures provide a way of illustrating a wide variety of satellite products, not to mention the kind of quality that can be obtained using home-constructed equipment.

If you send in some pictures, please include only photographic or FAX prints, as slides are difficult to handle. In addition to basic information as to the spacecraft and image coverage, be sure to include information on the receiving and display system you used to produce the picture.

This month's specimen is a NE WEFAX quadrant, imaged by the GOES E geostationary spacecraft and relayed by GOES Central (see Photo A). The image covers most of the United States and Mexico and part of Central America. The picture was obtained in visible light, transmitted on 1691 MHz, and displayed on a standard TV monitor using the scan converter described in the third edition of the *WSH*. Display resolution is 256 pixels/line with 256 lines and 16 grayscale steps.

I have already noted the problems inherent in deadlines. The other major problem in running this column will be space. I have been allotted a limited amount of copy each month. *73* has been positive in its coverage of weather satellite topics in the past, and WEATHERSAT represents a new and tangible expression of that support.

Your support of this venture has three dimensions. First, contribute ideas, information, or questions when you think you have something of interest. The remaining two dimensions are interrelated. Every once in awhile, drop a note off to the friendly publishing/editorial staff to tell them what a wonderful idea it is to have a column like this in their magazine and, just as important, *buy* the magazine. The most cost-effective way to do that and not miss any coverage is to subscribe. Subscriptions make publishers very happy, and happy publishers are very flexible about continuing to invest in columns like this one.

Next Month

Next month we will look at the general subject of satellite receivers for the VHF range. ■

"When You Buy, Say 73"

NEVER SAY DIE

from page 10

ago—I don't recall if I ever wrote about this.

It seemed that one of the graduates of a local Brooklyn street gang had come to him with a wild story. Several of his gang had joined the Air Force and had managed to get assigned to the same SAC group. They were waiting for the time when three were on the same flight together and then they planned to take over the plane and grab the nuclear bombs.

The idea was to set one up in Manhattan with a remote trigger and then demand a one-billion-dollar ransom—plus other demands. The government would have no choice but to pay and do anything else they asked, no matter how unreasonable.

The gang member who spilled the beans stopped the caper. The gang members were apprehended and the whole thing kept a total secret. What could the government do with those people? They sure couldn't just put them in prison and eventually free them.

My point is that, as crazy as that scheme sounds, it apparently came close to actually happening. One way or another, some group is going to get hold of a nuclear bomb. Fanatics will explode it where it'll do the most harm. Gangsters could demand more than we could give and detonate it—perhaps as a warning. If they had one they could have two.

When the nuke goes off we're going to have the same situation as California, only on the East Coast. Thousands to millions dead and perhaps tens of millions injured. That's going to take a lot of communications. You want to do anything about it or shall we just go on as we have and wait it out?

OLD FRIENDS

Are you taking advantage of the opportunities amateur radio offers you to find and develop friendships? Despite my wide range of interests, the friends I remember most fondly over the years have been ham friends.

Back in the late 40s I shared the low end of 75m with one Sam Harris W8UKS. Sam had a wonderfully wry sense of humor, so we got on famously. It was a bit frustrating for me when his 50 Watts of AM would knock my kilowatt out of the picture in South Africa. I had a pretty good dipole—Sam had a bi-square—so the ZS we'd talk to would tell Sam he thought he heard a slight heterodyne when I'd try to break in. Bah!

When I moved to Cleveland (changing to W8NSD at the time) to work for WXEL as a television director in 1951, I of course drove out to see Sam and his wife, Helen. I was surprised to find them living in the basement of their home. Well, Sam was building a house, so he first built the basement, then moved into it, and then quickly built his 120-foot tower. That's all the further he'd gotten with his home when I visited, ham priorities being what they were with him. His bi-square antenna hung from the tower. To turn it, Sam had to run out of the basement and trot the two sides of the antenna around with guy ropes. It had a whale of a signal—everywhere.

"When someone you're talking with over the air sounds like fun and he says why not come over—indeed, why not? And maybe bring some cake."

Sam, who died a few years ago, was a brilliant technician. In the 40s and 50s it was very unusual to run into someone with a beard—so naturally Sam wore one. I asked him if he noticed the stares it drew. Well, now and then he said he did—and wondered if maybe his fly was open.

Sam eventually moved to Medfield, an outskirt of Boston, to work for Microwave Associates. He had a basic mental problem—he had to have the loudest signal in the world on a band before he could be satisfied. This got him involved with some of the first moonbounce work on 2m—I think he had 14-elements on 20m. He changed his call to W1FZJ—then to W1BU.

When I took over *CQ* as editor in 1955, I got Sam to be my VHF editor. I'll never forget a great article he wrote on a contest 100-Watt final—complete with pictures of his finals. He had pairs of 1000-T finals, as I recall, for each band—running around 10 kilowatts or so each—all lined up around what had been his garage. I understood the FCC monitoring station in the next town had to shut down when Sam went on the air.

The article explained that the plate ammeter read a little high for 100 Watts—Sam suspected rf might be causing trouble. Sure enough, a quarter-inch bar of copper across the meter terminals shunted the rf and produced the expected 100-Watt reading.

This article was in response to the high percentage of operators who were winning the ARRL Sweepstakes contest by claiming to run only 100 Watts, thereby getting a 1.25 multiplier. Their rigs would be listed in *QST* with outlandishly high-powered finals—and 100 Watts input.

Sam was doing well until I moved to New Hampshire in 1962, soon after I started *73*. By 1963 I'd bought a mountaintop VHF location and set up 336 elements on 2m, 200 elements on 220, 400 elements on 432, and 16 elements on 6m. My 2m rig ran a kilowatt of rf with 4 kW of audio, producing a rather potent signal—all this from high up on Mt. Monadnock, the highest mountain in southern New Hampshire. Sam was stunned.

My 2m final was an old war surplus FM amplifier using 4-125As, modulated by the remains of a pre-war National 600 modulator, a beaut using Thordarson CHT transformers which I'd bought back in 1946—one of the better used-rig buys of my life. It easily punched 4 kW of audio into the final, providing a significant signal all down the East Coast; 600-mile contacts were common.

The next thing I knew Sam had moved to Puerto Rico and was gearing up the 1,000-foot dish at Arecibo for ham communications. Well, I couldn't top that!

Sam is the chap who invented the parametric amplifier, the device which added much to the range of military radars. He invented it on 6m and it was this device, I believe, which put Microwave Associates into big bucks. They're now MA/Com, the main outfit making satellite decoders.

Sadly, Sam was a heavy smoker—as was Helen W1HOY. This, I'm sure, shortened his life at least 20 years. We've learned recently that when a person dies, the spouse's immune system often weakens. Helen died not long after Sam, losing us a world-class 6m operator.

Now and then I'd get a chance to visit Sam—in Medfield—and then at Arecibo. We had a great time talking amateur radio, which he loved dearly—with Helen bringing him cups of coffee and perhaps some ice cream with blueberries. I don't think I remember a sit-down meal—just informal snacks now and then, brought to the operating desk.

Sam was a great ham, a wonderful technician, fun to talk with, and a solid friend. It's hams like Sam and Helen who have helped make amateur radio mean so much to me.

Another very good ham friend of mine has a wife who hates hams—including me, I suspect. All kinds.

Immediately after World War II I got back on the air—first on 112 MHz (two and a half meters), which was the first post-war ham band to open—then on 10m, which opened a few weeks later. I was stationed at New London, teaching radio and radar at the Submarine Base—having been transferred from my submarine in the Pacific just before the war ended. On weekends I'd drive home to Brooklyn, where I got on 10m.

Two of the more active hams at the time were Eddie Ricca W2OCL and Frank Rizzo W2OCM. Groups of local hams would often get together at Eddie's house in the evening to ragchew—and be served coffee and cake by his wife, Jeanette. Eddie was a projectionist at a local race track—he later moved to Florida and got involved with the International Traffic Net up in the 14.300s.

We built up quite a bunch of hams around Brooklyn on 10m in the evenings. The band was closed, so it was much like the old pre-war 160m band. We'd gather a group of maybe ten or so joshing each other and then someone would suggest meeting at Nathan's at Coney Island for a hot dog. We'd all drive out there and nosh. Nathan's, by the way, had the best hot dogs in the world.

Another old-timer I remember

fondly was Garald Silsby W1MCS, from my home town of Littleton NH. Sil ran a radio repair store in town and operated a 25-Watt 80m CW rig from his camp on Partridge Lake. He did radio repair the old-fashioned way—if a transformer burnt out he'd rewind it, not just reach for a replacement.

Then there was the first chap I contacted the day I got my ticket—Dexter Poindexter W2MCV. Dexter was the sort of ham who pored over the ham magazines endlessly, talking for hours on either 2.5m or 160m about his next big receiver purchase. Dexter lived for the day he would finally decide what receiver to buy. Alas, he spent more time than he had on the decision, dying before he bought the receiver he'd dreamed of for so long.

My rig was a 2.5m walkie-talkie built from an article in *Radio*—kind of the pre-war version of *73*. Two tubes and a pair of long lines for a tank circuit.

Hams still ask me about John Williams W2BFD—he died fairly young in 1961—smoking killed him. John was certainly the father of RTTY. He made the first deals to rescue Teletype machines from Ma Bell. He warehoused and distributed them. He designed the first circuits—which I suspect are much better than many we're using today. He (with help from me) set up the first two-meter repeater in the country to repeat RTTY throughout the greater New York City area. It was controlled on channel so the FCC was furious, wanting him to set up a separate 220-MHz control link. It worked beautifully.

John had other interests, too, as I found out one day when the FBI visited me. I later found out his electronic genius was also spent on making state-of-the-art surveillance equipment. He mentioned once providing the Arabs with bugs to put on Israeli diplomatic cars so they could hear what was being said inside.

John was careless, at times to the point of being crooked, with the delivery of Teletype equipment. But most of us used his designs and were held together by his signal from Woodside, Queens—and then by his repeater.

He built one of the first telephone answering machines. I've still got it down in my basement. He used a homemade phonograph record to answer the phone and a wire recorder to record the incoming messages. Bell really hated this, but John stood them off until he died. He lived about a mile from his radio repair store and connected the two via 162 kHz over the power lines so he was able to talk over his store telephone from home. Not bad for the 50s.

I met Walt Chamberlin W6LLP when he came to New York to install a color organ on a Guggenheim Fellowship. If you've seen the Guggenheim Museum on 5th Avenue, the color organ is the reason it's such a strange shape. The color organ was supposed to be the centerpiece, so Frank Lloyd Wright designed the building around it.

Walt was into RTTY, so he looked me up when he got to New York. He'd helped the color organ inventor, Charles Dockum, build his first test model and came with him to help build a bigger one.

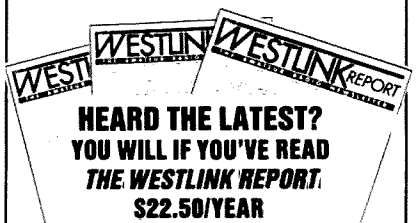
Once the new color organ was up and running, Walt went back to Pasadena and I took over as the engineer on the project—mostly to keep it running. It was a great invention, but it took a lot of control equipment and power tubes to run the four 70mm film projectors, each with three films controlled independently. Alas, today you can do everything it could do—and more—with microprocessors, and you wouldn't even need the projectors.

I had more fun composing color/light programs on the organ than keeping it working and developing new circuits. Alas, eventually a new museum director was appointed and he nixed the color organ. It may still be sitting somewhere in a warehouse for all I know.

The organ was set up in the old Guggenheim building, on the same site as the present one. While I was working there I operated on 2m from the penthouse apartment overlooking Central Park. It was a great location.

I used to visit Walt in Pasadena in the 50s. He went to work for NCR making computers, and we drifted apart as I got to L.A. less often. I don't see him listed in the *Callbook*, so perhaps being a vegetarian didn't keep him alive. I can't imagine him dropping his ham ticket.

Oh, there've been many hams I've known down through the years—some wonderful people. But you have to take time to develop friends. When someone you're talking with over the air sounds like fun and he says why not come over—indeed, why not? And maybe bring some cake.



Here you have the whole world at your fingertips—thousands of fascinating people anxious to talk with you. You sit down, turn on the rig switch and there they are. If you want to be alone, off goes the switch and you're by yourself. If you want good friends you're going to have to work at it—and you'll get out everything you put into the relationships, and then some.

Of course if you're a snide, sarcastic, put-down person, the more you put into a relationship, the less you'll get out. You might want to tape a few contacts and then sit down and listen carefully to them to see what kind of a person you are to contact. Are you someone you'd call again? Some people are so used to being negative they spread gloom with every contact. It can take hours to air out a frequency after a couple of chaps like this have been bitching.

You might want to explain that hamming is supposed to be fun the next time you hear a curmudgeon griping—but be prepared for the blast of fury. No, I don't think you'll find anyone with the guts to back you up—you're on your own in trying to improve our bands. The most infuriating thing you can do is be unflappable.

Both you and I will enjoy hamming much more if we do our best to avoid the rotten operators and look for the chaps who are fun to talk with—who are worth developing as friends. ■

Number 28 on your Feedback card

NOTES FROM FN42

There are many activities around the world that could be reported here—which *you* could tell us about firsthand if they were happening in your country... much better than we could, using secondhand information. The July issue of *World Press Review*, published in New York, excerpted from press reports on new satellites in Japan...on the personal computer boom in the Ivory Coast and Senegal Republics...and on an aspect of the government in Norway, which perhaps could mean more Norwegian YLs and XYLs.... Is there anyone out there who can tell us more than the following?

NKH (Nippon Hoso Kyokai), Japan's giant public broadcasting system, is experimenting this month with the new television satellite, the BS-2b; its made-at-home BS-3 is scheduled to fly in 1988. NKH *encourages* private dish antennas; half a million are expected by 1988. (From remarks in Tokyo to *WPR*'s "World Beat," by Norio Shimamura, NKH editor for foreign news.)

Personal computer nets are popular in two African countries, Ivory Coast and Senegal; Senegal reportedly unveiled the first PC to be designed and built in Africa. It is a computer boom, according to El Inkichari, in the Paris *Le Journal de L'Economie Africaine* [5/15/86].

Is the Norwegian Telecommunication Direktorat headed by an XYL or YL? That's a reasonable question since Norway now leads the world in the number of women in top governmental leadership positions: Gro Harlem Brundtlandt is Prime Minister, and she has named women to seven cabinet posts—which is nearly half of that body. (From an article by Birgit Wiig in Oslo's *Dagbladet* [5/20/86].) If so, could that not lead to an increase in the number of YL and XYL ops in that country?

Let's hear from *you* (particularly if you know more about the above) and from more countries. This is an *"International"* column! We've "flown the flags" of 59 countries so far, with no nationalistic sort of favoritism (amateur radio is an *international* hobby) —let us "fly" your flag, too.—*International Editor.*

ARGENTINA

Marcelo "Mac" F. Avila LU5EIC
Radio Club Boulogne
C. C. 39–(1609)
Boulogne Sur Mer
Buenos Aires
Argentina

I've much pleasure writing you about the new special callsign that began appearing this year and will be used through this month [October]. The Secretaria de Estado de Comunicaciones (Communications State Secretary) has authorized Argentine amateur radio clubs to use the AZ1ARU callsign to commemorate the IX Plenary Assembly of IARU Region II in Buenos Aires this month.

The Radio Club Argentino (LU4AA) uses the call without the portable; all other ARCs use one, as mine (Radio Club Boulogne) uses AZ1ARU/15, that can be considered as an AZ15 prefix.

All stations have a QSL Manager, using his own or the club callsign (Radio Club Argentino uses its own; Radio Club Boulogne uses mine: LU5EIC). Be sure to use the QSL information you are given by any AZ1ARU station you contact!

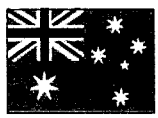
DOC GETS TEETH!



Thanks to the long-awaited replacement of the 80-year-old Wireless Telegraphy Act with the Radiocommunications Act, the Department of Communications now has a "vitally important" tool for the efficient management of the radio-frequency spectrum. There is a vast range of uses being made of the spectrum, and the new Act recognizes the modern electronic environment and the issue of electromagnetic compatibility (EMC).

Formulation of the Act over the last 15 years involved the slow process of consultation with manufacturers, importers, and all spectrum users, and the Wireless Institute of Australia was a part of the process through its CASPER Committee; all this will continue as regulations and standards evolve.

DOC will have new powers to deal with all forms of radio frequency interference, from *all* sources—power lines, electric motors, welders, thermostats, and so on. TV sets, VCRs, stereo units, intercoms, and other such devices sold in Australia will have to meet standards of immunity to RFI. It will be an offense to supply, possess, or use equipment manufactured after the setting of standards which does not comply with those standards.

The Act redefines a number of new offenses, such as using a transmitter that causes interference to safety communications, harassing another person, or sending hoax calls. In the last category, differences are clear from two hoax cases, the first prosecuted under the old Act and the second under the new. A Queenslander who made repeated calls to emergency services on marine distress channels, claiming he was in a boat with others outside the Southport sandbar when he was, in fact, transmitting from his home on equipment borrowed from an equally unlicensed friend, lost the equipment and was fined $300 plus costs. Just recently, another Queenslander made straightforward distress calls to the Cairns Coastguard—and he was fined $2,500 and lost a $150 marine transceiver and a $200 CB transceiver.

I must thank the WIA's amateur radio magazine and Mr. Bill Palmer, DOC Public Relations, for the above information.

NORFOLK ISLAND

Kirsti Jenkins-Smith VK9NL
PO Box 90
Norfolk Island, 2899
Australia

When the Pitcairners stepped ashore on Norfolk Island in 1856, they looked around them in amazement. These were the second and third generation descendants of the famous Bounty mutineers who had sought refuge on Pitcairn Island after casting Captain Bligh adrift in an open boat.

As generation followed generation, Pitcairn Island had become too small for the 193 descendants. A larger island was needed, preferably one where they could continue their isolated existence free from interference from the outside world. So Norfolk Island had been offered for their new home. The penal colony had been closed, leaving buildings, fields, and livestock for the Pitcairners' use.

The people, after an exhausting voyage of over 3,000 miles, lasting five weeks, felt bewildered. Stone buildings, some two or three stories high, looked large and formidable. And the herds of cattle grazing were something new. They had had nothing like that on Pitcairn.

Many found it difficult to settle down in these new and strange surroundings. Their very life style was changed. And before long, several of the Pitcairners contemplated a speedy return to Pitcairn. Two and a half years after their arrival, two families returned to Pitcairn Island. An extract from an old diary on Norfolk Island reads: "...after a scene of sorrow and pity, several of the relatives going into hysterics, etc., they embarked and in the afternoon sailed...."

In 1864 a second group departed Norfolk for Pitcairn Island. And so we have it that the descendants of the Bounty mutineers are to be found on both Norfolk and Pitcairn Islands.

Relatives were separated for years with no news, although a few letters found their way by slow—very slow—mail. But maybe the longing for a return to Pitcairn was laid down in the Norfolk Islanders' genes. As the years passed, each generation talked about Pitcairn Island and how they wished they could see it one day.

With the coming of amateur radio, communications were improved. John VK9JA and Ray VK9RH (now SK) talked regularly with Tom VR6TC, who was the only operator on Pitcairn in those days. By 1984 the amateur radio population on Pitcairn had doubled—to two resident operators. Kari VR6KY had been active for some time, and she and I provid-

ed another link between the two Islands.

It was now that the day finally came to pass that generations of Norfolkers had longed for. A group of people from Norfolk Island travelled via New Zealand and Tahiti, then onward by chartered vessel, to Pitcairn Island...and the way these long-lost relatives greeted each other gave no indication of the passage of 120 years since the last group had departed Norfolk Island for Pitcairn.

Anticipation had been strong. On Norfolk Island we received via amateur radio hasty little progress reports from Pitcairn while the group was en route. "We are busy baking extra bread...we are giving our houses a good spring clean...do you know the names of those coming here?" And then finally, "The men are all up in the hills on the lookout for the ship!"

Oh, joy! Eight days of talking, laughing, exploring the island, singing, and feasting. Then time for departure.

The bonds between the two islands had been strengthened. Fortunately, propagation was not too bad in the months that followed, and one day Kari and I set up a special Christmas sked. She would gather a group of Pitcairners in her house and I would gather a group of Norfolkers in my house. A little mike-shy to begin with, "my" group soon warmed up. So did "Karl's" group. Soon everyone was bubbling over with things to say, questions that wanted answers, and promises of visits to come.

Pitcairn and Norfolk have their own version of the English language. Called Pitcairnese and Norfolkese, it is a mixture of 18th century English and Tahitian words adopted from the mutineers' Tahitian wives. The language has survived successfully even here on Norfolk Island, which has been subjected to a large influx of new settlers. So the one-hour Pitcairn/Norfolk sked was conducted in their own language. Later, to tidy things up, Kari and I tied the ribbons on the sked in Norwegian!

The exercise proved that amateur radio is an excellent medium for keeping isolated communities in touch on a more personal basis than telephone calls or infrequent letters. At present propagation is too unreliable, but once that improves Kari and I will resume our regular skeds, helping to strengthen the tie between these two islands which share an interesting chapter in the history of the South Pacific.

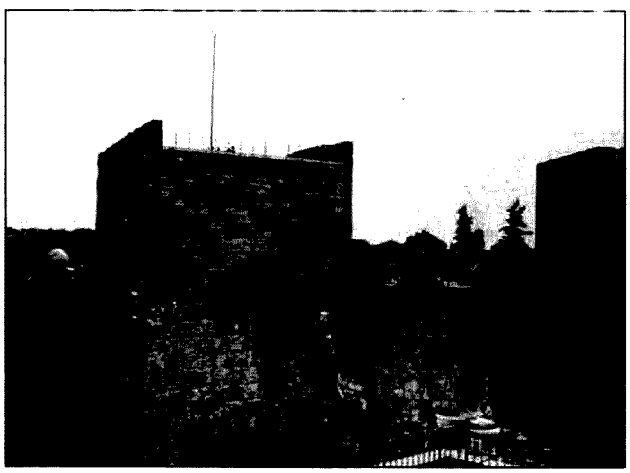
CW GOLDEN HOURS

It happened in Rolandia, Parana State, when Flores PY5BXW suffered a heart attack which damaged almost three-fourths of his heart and left him unable to move except for slight finger wiggles and winking eyelids.

Taken to the hospital, almost no hope given him by the medical team, unable to communicate in any way, Flores seemed condemned—when his wife, Cida, remembered CW and asked her son if he thought Flores would be able to understand a CW message. Her son called on a friend of Flores, Rossini PY5CFT. At the hospital emergency center, earphones were placed to Flores' ears and, by Morse code, Rossini asked Flores to wink his eyes if he understood the message.

There was winking, and Rossini told Flores that he was going to put an oscillator key under his fingers, hoping he would be able to express his feelings.

Then, like a miracle, Flores started slowly but steadily to send a message about some strong pains, thus allowing immediate help from the medical team and bringing Flores such relief that the whole situation was changed: Calmness and courage resulted in new hope. The medical team was astonished with what they were seeing, never having imagined that a motionless patient could ever communicate information about himself.



Rossini stood by from then on, always ready to copy Flores' messages and translate them to the medical team and family. Anguish and the barrier of silence were surpassed, and little by little Flores' CW messages poured from his fingers, instructions to his sons about how to take care of the farm and lands– and of everything else, showing that Flores knew how severe the heart attack had been.

"Cida, if anything happens, I want you to know you were the happiest thing in my life..." was one of his messages.

Morse code. What so many have called "good for nothing" cannot be judged if measured or imagined by common parameters. Is it worthwhile knowing? Well, "knowing takes no space and has no weight...."

Unfortunately, Flores could not stand such a severe infarct and died three days later. "Rossini, I feel I'm going to die," was Flores' last message, this one very hard for Rossini to get despite his CW skill.

Although he dedicated his whole amateur radio life to CW operation, we don't think Flores ever imagined he was going to write such Golden Hours to CW, a so important example for us all to think about.

ACTIVITY WEEK—OLD CITY OF JERUSALEM

Readers of my April and September columns last year, here in *73* International, will recall the 4X5DS expedition to the lowest spot on the face of the Earth, the Dead Sea. The Holon Bat-Yam Club, which pulled off that operation, decided that this year they would do a similar week-long stint, but this time, as Aharon 4X4AT put it, to the highest spot in the world—spiritually speaking. Hence, the 4X5J operation.

After careful preparation of equipment and skyhooks and securing the necessary authorizations from the authorities-that-be, the station was set up in David's Citadel just inside the Jaffa Gate of the Old City of Jerusalem's walls. The time: from the 24th of April through May 1, the week of the Passover festival, when schools and many businesses are closed, ensuring sufficient numbers of operators for around-the-clock activity.

It would seem that the operation enjoyed the full support of nature, as the tribander and dipoles perched on the Pata'el Tower, two transceivers and their amplifiers performed flawlessly throughout the week-long period. Not only that, but conditions were excellent, especially for this juncture of the sunspot cycle. The evidence: over 8,000 contacts with 120 countries and 47 American states.

Publicity wasn't lacking, either. Israeli television was on hand, and the viewing public was treated to a four-minute-long item on the late-night news showing antennas, the station in operation, and an interview with the chairman of the Israel Amateur Radio Club (IARC) explaining the importance of the operation. Israel Radio's English language service also devoted time to the activity, and on Ben Dalfen's DX Corner (4Z4JS) on the Overseas Service, listeners received full information on 4X5J.

Mayor Kollek signs a QSL card as Aharon 4X4AT watches. Standing, from left: Amos 4X6PH, Amir 4X6TT, an unidentified SWL, Asaf 4X6MH, Shoshana 4X6OL, and Dudu, the manager of the David's Citadel Museum.

The 4X5J QSL card shows The Citadel.

Mayor Teddy Kollek of Jerusalem paid a special visit to the station and made a contact in the German language with DJ8OT. The public, including many tourists, also visited, and, indeed, the activity was such a hit that the curator of the King David's Citadel Museum, in the rooms of which the operation was housed, invited the operators to return each year, making it an annual affair.

A revival in activity on HF took place with the Jerusalem amateurs, who discovered that with 4X4J operation hams worldwide were interested in the coveted Jerusalem Award. As a result, they pressed their stations into activity and found themselves to be very much in demand.

Jerusalem Award Changes

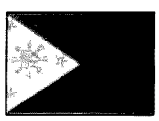
The requirements for the Jerusalem Award have been considerably relaxed, making it much more readily available for most amateurs. All that is required now are contacts with four *different* Jerusalem stations, and no more. QSLs are not necessary—just a log of the contacts verified by two other licensed amateurs, sent along with four IRCs to the award manager, Dr. Milt Gordon 4X6AA, PO Box 4079, Jerusalem, Israel. However, if you were fortunate enough to make contact with 4X5J, then the Holon Bat-Yam Club will take care of all expenses for the award and no IRCs will be necessary. Send your log, with the record of the contact, to 4X5J, c/o The Israel Amateur Radio Club, PO Box 4099, 61040 Tel Aviv, Israel. To the best of my knowledge, the club is already sending out OSLs for all contacts with 4X5J, making absolutely no solicitations, in the same way that they handled 4X5DS last year.

In summation, the 4X5J operation was a big success. Thanks are due to scores of hams who gave freely of their time, equipment, and funds to make this DXpedition the triumph that It was. The Holon Bat-Yam has some different plans for next year. What they are is not yet known, but I shall try to inform you in advance!

BIG EXAM TURNOUT

While amateur radio seems to be declining in many countries, it seems that the great publicity received by ham radio in Israel coupled with hard work by the Elmers or counselors at the various local clubs has really paid off.

In the spring examinations for the amateur radio license, 170 examinees came for the three different license classes! The results are not out yet, but according to IARC volunteer observers, the percentage of those passing was high.



Although according to a survey made on the air that most amateurs here would favor some kind of code-free license giving some kind of VHF privileges, the Ministry of Communications still does not favor the idea. Even so, amateur radio here is still growing; but it would seem that we're losing many talented youngsters to computers as a result of the licensing requirements.

VISITOR LICENSING

It's time to remind you that when you visit here you should bring along a small, two-metre hand-held and meet the hams here, thus adding a beautiful human dimension to your trip to Israel. On a radio program recently I heard the figures regarding the number of murders per capita in large cities in America and Europe. It was interesting to note that in spite of the big terrorist scare keeping people from going outside the borders of the U.S., the number of those meeting violence in Israel is *considerably* smaller than that of major American cities. You are immensely safer on the streets of Jerusalem or Tel Aviv than in New York, Chicago, L.A., Detroit, etc., and you can stroll safely at all hours.

If your country has a reciprocal licensing agreement with Israel or if you can provide proof that Israeli hams receive licensing privileges in your country without additional exams, then when you come bring your valid amateur license with you (NOT a photocopy). Your reciprocal license shall be granted on the spot, free of charge. Just appear at the Ministry of Communications' offices on the tenth floor of the Shalom Tower on Ahad Ha'am Street (it is Tel Aviv's tallest building). Office hours are 9 a.m. to 1 p.m., Sundays through Thursdays; the phone number is 610-278 (dial 03 first from outside Tel Aviv).

I'll write soon to bring you up-to-date on all the repeater channels. Hope to work you on two metres—remember, Israel loves visitors!

PHILIPPINES

(We are half chagrined, half confused, and half pleasantly mystified about the material we published in the March, 1986, issue from Senor Leo Almazon WA6LOS/DU2, our Philippines correspondent. It included interesting information about a February, 1985, Hamvention—not exactly hot *news, but in this column that doesn't matter—and went on to mention "the plan for the next SEANET convention. . . in DU-land [and] the tentative dates are November 22 through 24. . . ."*

(It was too late to do anything about that when we suddenly realized that that SEANET affair had already been held, five months before, in November of 1985.

(Now we have more material from Sr. Almazon, just as interesting as his material usually is, postmarked June 24, 1986. We decided to read it carefully! *It speaks of a decision which "will be heard after the Presidential election in February." And it ends with his plan "to attend my very first Dayton Ham convention. I will drop by the 73 Magazine booth and say my hello. . . ."*

(Some of you who see American TV will know what we mean when we say we felt as if we were suddenly in The Twilight Zone! Yes, the Dayton Hamvention was held two months before *Sr. Almazon's communication to us was postmarked. Of course there is a simple explanation! We will share it with you when we find out what it is. Stay tuned.)* ■

ABOVE AND BEYOND

Morris Plains NJ 07950

A few months ago, I touched on the importance of 6 meters during the early (June and July) VHF contests. Many a great effort has been made by the grace of a strong Es opening on 50 MHz!

It's been a few months since the running of the 1986 *CQ* WW VHF WPX Contest, but 6 meters came through in a big way to help our group (SCORE, operating KC2PX) ring up some interesting totals.

Overall, 6-meter activity was fairly good locally. But when the band opened up, things got interesting! Just prior to the contest, there were strong Es openings to virtually every part of the country—from Newfoundland to California. These openings lasted off and on for several days and activity was detected from Minnesota to Missouri the afternoon of July 18 as I set off for our contest site.

Alas, Murphy stepped in and the scatter disappeared, but only temporarily! For the first 2-1/2 hours, we worked into New England, eastern Pennsylvania, New Jersey, Maryland, Massachusetts, and New York with signals consistently about S9 to S3. Suddenly, at 10:30 p.m., in the midst of all these local contacts, two stations from grid square DN13, western Idaho, punched through with S9 signals, and exchanges were quickly made! Our excitement rose and we were rewarded with intermittent Es openings for the next 1-1/2 hours into Florida, Arkansas, Tennessee, Alabama, and Texas.

I found myself in a rag-chew at midnight with K5UR in Arkansas and N4EJW in Florida (both stations were S9 +20), lamenting the lack of activity for such a great opening! The late hour may have had something to do with it, but 6 continued to show sporadic openings throughout the night, and many stations that we might have struggled to work on meteor scatter were "easy pickin's" via Es.

We resumed operating the next day at about 7:30 a.m., running local stations for a bit. A few meteor scatter contacts were made into the Midwest, but things were quiet until about 2 p.m. when the band opened up again, this time into Florida, Tennessee, and even as close as North Carolina! Stations were worked at the southern tip of Louisiana (EL59) and along the Florida panhandle (EL79). The skip appeared to be concentrated mostly in the Deep South, with occasional pings from Missouri and Texas.

Periodically checking the logs made for an interesting contrast since the 2-meter station was running about double the contacts, but 6 was producing twice as many prefix multipliers. More stations were bagged along the Gulf Coast, indicating the presence of an E-cloud somewhere over the Tennessee River valley. We suspected, and rightly so, that we would soon be hearing from states north of the E-cloud. Sure enough, here came contacts in EN51 (west and south of Chicago), EN41 (western Illinois), EN1Ø (southeastern Nebraska), and EN31 (Des Moines).

The 6-meter operators were busier than one-armed paperhangers at this point. It was a good opening—no terrifically strong signals, but plenty to work with—when another surprising development took placel In the midst of running the Midwest contacts, some Southwestern grids started popping through, such as DM84 (eastern New Mexico/western Texas), DM41 (Mexico/Arizona border), DNØ7 (Yakima, Washington), and CN85 (Portland, Oregon). This was getting interesting.

At this point, about 9 p.m. local time, we were working stations from Florida to Washington, with New Mexico, Arizona, Idaho, Texas, and northern Minnesota thrown in for good measure. It was one of the stranger Es openings I've seen, for despite the westward and northward trend, we never once heard a peep from California—a prefix we dearly needed. Yet, we were able to work Newfoundland at the tail end of the opening, indicating the presence of another E-cloud over the Atlantic! (Rumors floating around Sunday morning indicated that indeed G2 and G3 stations were hearing U.S. signals, and that a few contacts may have been made.)

This was the last substantial opening for the rest of the contest. During these two openings, KC2PX logged about 100 grid squares as well, making VUCC in two days. The enclosed map (Fig. 1) gives you an idea of what was worked from our location in Belle Mead, central New Jersey (grid square FNØØ). It's apparent that the E-clouds occurred mostly over the Mississippi valley and the Tennessee River valley, accounting for the activity in the eastern half of the country. What caused the openings to the west? Most likely double-hop sporadic-E, not a very common occurrence!

We finished with 234 QSOs and 81 prefixes on 50 MHz, meaning about every third station worked was a new prefix. Contrast that with a total of 379 QSOs on 144 MHz and 68 prefixes, which works out to about a new multiplier every sixth contact. No doubt about it, 6 meters is a very important band during a VHF contest.

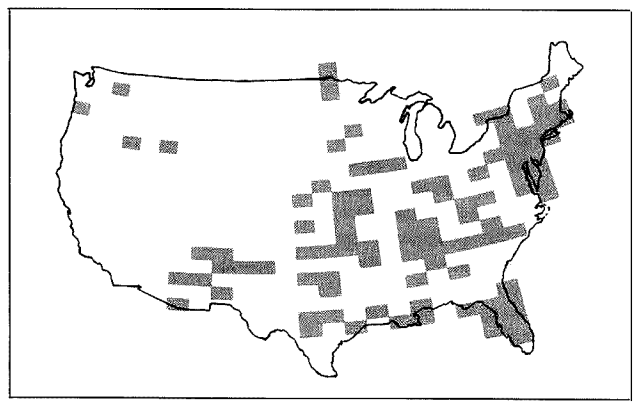

Fig. 1. Grid squares worked by station KC2PX during the 1986 CQ WW VHF WPX Contest.

Measurements

Every VHFer likes to know more about what's going on in his or her station with regard to performance. . . such as antenna gain, noise figure, power output, swr, etc. Some of these quantities are not easy to measure, but some are and I'll try to suggest some appropriate test gear that can be found cheaply at flea markets to do the job.

Let's start with the most popular measurement: power. I personally rely on Bird model 43 wattmeters and elements, but there are other units available that can do the job nearly as well. Mirage makes a nice line of VHF/UHF wattmeters that are reasonably priced in the $100 range. Also available are units from Welz (which don't have the resolution of a Bird but are reasonably close on VHF) and from Daiwa (which are less accurate than the Welz, based on my own observations).

Heathkit used to make a nice wattmeter for VHF called the HM-2102, which was surprisingly accurate. It used a toroidal coupler (as does the Daiwa) for both 50- and 144-MHz measurements. These can be found for about $25 to $35 at flea markets. The newer Heath meters work much the same way, but I haven't had a chance to use one and evaluate it. EME Electronics in Germany makes a nice multiband unit using a 50-directional coupler and voltage dividers to achieve coverage on 144, 432, 1296, and 2304 MHz.

Of course, you can roll your own, too. Circuits have appeared in the ARRL *Handbook* for Monimatches and 50-Ohm transmission-line couplers that can be made from PC board and plumbing supplies. A Monimatch circuit can also be used to indicate swr by calibrating the Reverse Power diode's output. Fig. 2 shows a typical Monimatch circuit with the bare essentials. This is similar to the cheap wattmeter I wrote up for *73* in September of 1984.

Another excellent meter that has been around for a long time was made by the MC Jones company of Bristol, Connecticut. You'll often find them attached to a resistive-type coupler in a cylinder with SO-239 connectors at either end. MC Jones also made a line of UHF and VHF directional couplers with microwave diodes that work very well. I have seen these available at numerous hamfests for about $25 for the meter

and resistive coupler, and the VHF/UHF couplers usually run in the range of $20–$30 apiece.

Last month I outlined a procedure for gain measurement using a known signal source. Where do you get the source and how do you measure it? There are plenty of surplus test equipment buys at flea markets. You might be able to find a Boonton Radio rf signal generator for a reasonable price. I saw four at Dayton this year for about $50–$75 each. They will cover up to 200 MHz in band-switched ranges. If you have a bit more cash, $200–$300 will get you a Hewlett-Packard 608 series rf signal generator, with outputs up to 450 MHz depending on the letter code following the model number.

Boonton Electronics makes many fine millivolt and milliwatt rf meters that can be had reasonably if you look hard enough. I picked up a model 902 for a song, but had to fork over $50 for a surplus 50-Ohm detector head (good to 600 MHz). This is what I use to align transverters and other low-level signal sources. I also employ a good frequency counter made by Ramsey Electronics. You don't have to spend a fortune to get a good counter, only about $65–$95 for coverage to 600 MHz if you look around.

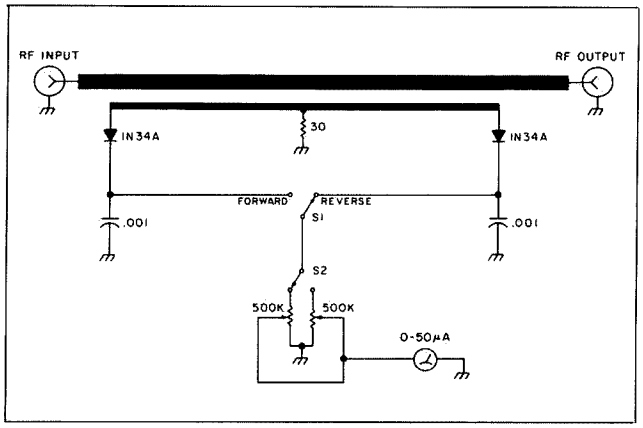

Fig. 2. The simple Monimatch circuit is the directional coupler found in most rf wattmeters.

And, of course, let's not forget the time-honored VTVM (or its modern-day counterpart, the FETVOM). This may be the most useful gadget around the shack for making voltage, current, and low-level rf measurements. You can fabricate a 50-Ohm coupler and use the VTVM/FETVOM as a meter readout for power and swr if need be. Such a VTVM might run from $25 to $50 in a flea market. As I come across other surplus buys, I'll keep you posted via this column.

Where Is Everybody?

I hear stories often of the newcomer to VHF or UHF who spends $900 for a multimode radio, antenna, and amplifier, only to complain that there's no one to work. If you tune around 432 MHz on a Saturday afternoon, that would be a valid conclusion! It's time to talk about the concept of activity hours, when your chances of making a QSO improve by leaps and bounds.

On the East Coast and in much of the country, certain hours of certain evenings are designated activity hours to encourage operators to get on the more popular VHF and UHF bands. The convention is that Monday is 50-MHz and 144-MHz night, Tuesday 220-MHz night, Wednesday 432-MHz night, and Thursday 1296-MHz night. In addition, the following hours are used conventionally for activity any night as well: 8–9 p.m. local, 220 MHz; 9–10 p.m. local, 432 MHz; 10–11 p.m. local, 1296 MHz. Also, during contests you'll find the most activity on these bands during these hours. It saves you having to waste your valuable Sunday afternoons calling CQ on 220 MHz until you're blue in the face.

That's it for this month. I'd like to hear from any readers who participated in last summer's contest schedule and their comments as well, with particular interest in portable or mountaintop operations. Until next month, see you Above and Beyond! ■

here is the next generation Repeater

MARK 4CR

The **only** repeaters and controllers with REAL SPEECH!

No other repeaters or controllers match Mark 4 in capability and features. That's why Mark 4 is the performance leader at amateur and commercial repeater sites around the world. Only Mark 4 gives you Message Master™ real speech • voice readout of received signal strength, deviation, and frequency error • 4-channel receiver voting • clock time announcements and function control • 7-helical filter receiver • extensive phone patch functions. Unlike others, Mark 4 even includes power supply and a handsome cabinet.

Call or write for specifications on the repeater, controller, and receiver winners.

Create messages just by talking. Speak any phrases or words in any languages or dialect and *your own voice* is stored instantly in solid-state memory. Perfect for emergency warnings, club news bulletins, and DX alerts. Create unique ID and tail messages, and the ultimate in a real speech user mailbox — only with a Mark 4.

ME AND PRESIDENT FAHRQUAR

Have you ever heard of former ARRL president Roland P. Fahrquar? Neither have I. But since I'm about to tell you a slightly embarrassing story about an ARRL president we have all known, and since I don't want to lose my house to a messy libel suit, let's just give him that name. Roland P. Fahrquar. President Roland P. Fahrquar. Sounds like a League president's moniker, doesn't it?

Anyway, our story begins at a League convention some years back. My brother Jim WB2LWJ and I had just been licensed for a few years and we decided it was time to see what these ARRL shindigs were all about. So we were in this Playboy Resort hotel in rural New Jersey, and on the first day we were in an elevator traveling to the fourth floor to see the world premiere of a brand new ham radio film, produced by the League.

So we got into this elevator. Almost immediately, I recognized the face of President Fahrquar. I mean, how could you not recognize him? Each month, his mug was literally plastered over the pages of *QST*. In the November issue alone, his face appeared no less than three times. On page 11, Fahrquar was presenting the Buckeye Amateur of the Year Award to a 7-year-old who managed to save an entire family by diverting a lightning strike through his Lafayette code practice key. Page 32 pictured Fahrquar representing the International Amateur Radio Union at the World Administrative Radio Conference (held on the French Riviera, of course). And, just for good measure, Fahrquar was shown on page 62 cutting the ribbon at the opening of the new Andy Devine Annex to League headquarters. This was a man very conscious of his public image.

So anyway, here we are all in this one elevator, Fahrquar, my brother, and me. Jim obviously failed to realize we were in an exalted presence.

"I hope this film is good," said brother Jim.

"I hope so, too," I replied.

"I hope it's not like the one we saw at the Novice class last year," he said. "That one really stunk up the room."

I began dying. I mean, after all, one does not insult a League film in front of the president.

"You know, the League has a real warped idea of what film making is all about," said Jim, now seriously into his film critic mode. "They think they can stick Arthur Godfrey and a ukulele into a picture, show the guy's million-dollar ham shack, and win over the kids. They're full of it."

By this time, I was inspecting the cobwebs on the elevator's ceiling, and Fahrquar was blowing smoke rings out of his ears. Turning toward Jim, Fahrquar, barely able to speak, croaked out, "Well, maybe you'll like this film better." The doors opened and he stalked out.

"For an instant that distressed-looking fellow in the sculpture "Ugolino and His Sons" looked like Fahrquar. Then, on second glance . . . no, of course not."

"Who the heck was that?" asked Jim.

"Roland P. Fahrquar, the ARRL president," I said.

"Golly, I hope he didn't take it personally," said Jim.

Over the course of the next several months, Jim and I ran into Fahrquar on a number of occasions. Pretty soon, we took to, as Jim termed it, "Freaking out Fahrquar."

It would work like this. Say Fahrquar was the scheduled speaker at the Hall of Science Radio Club, a popular ham radio establishment in the late 1970s. Jim and I would grab front row seats. We would dress identically in traditional ham garb: slacks, red plaid flannel shirts, and baseball caps. Fahrquar would arrive at the podium, look up to deliver his speech, and instantly see the two of us and freeze up. Jim and I look a lot alike (fat and dopey), and since we would sit there with silly grins on our faces throughout his entire speech, it would throw him into a panic, really rattle him. Maybe he thought we were aliens intent on subverting the ARRL. Who knows what thoughts pass through the brains of ARRL officials.

We kept it up. At the LIMARC flea market on Long Island the next spring, we spotted Fahrquar manning the League table. We walked up to the exhibit in unison and, in a nursery rhyme sort of sing-song, jointly chanted the words:

"We Are Here to Offer Our Services to the ARRL;

If You Don't Want Us, Just Say, 'Go to . . .' "

Well, you can guess the rest of the rhyme.

Fahrquar got a sort of ill look on his face and shooed us away.

After awhile, we got bored with the whole thing. I mean, how long can you pick on an ARRL president? It got to be kind of cruel—like teasing goldfish or stealing your pet dog's favorite bone. It just wasn't the sort of thing we wanted to keep on doing.

But then something strange happened. Try as we might, we couldn't get away from old Fahrquar. For instance, Jim and I would drive out to Harrison's, the big electronics store out on Route 110, and there would be Fahrquar idly spinning the vfo on a Drake TR-4C. He would give us a sly sort of smile and then disappear behind a rack of RCA connectors.

This happened a few times. We would go to the local repeater council meeting, and there would be ol' Fahrquar grinning at us. We would help out at the March of Dimes Walkathon in Manhattan, and there was Fahrquar, eyeing us over the top of an HT-220. What was going on here? We were supposed to be freaking him out and here he is grinning at us and making us . . . the great freaker-outers . . . feel very, very uncomfortable.

Soon, Fahrquar was popping up where he had no business being. I mean, running into the old fella at an electronics store or a repeater council meeting made sense, but how could you explain seeing the guy at a movie theater in Forest Hills or playing the slots in Atlantic City? League presidents don't play slots. I mean, what sort of an example would that set for Novices? Most Novices I'm familiar with settle for nothing less than baccarat.

There was no explanation, of course. Or was there? Sure . . . it was a League plot. Yeah, right. The League was out to get Jim and me. No, that's crazy. Why should the League be out to get us? No, Fahrquar was after us. He was giving us his righteous retribution for laughing at the film and playing gags on him at the Hall of Science. Or was he?

We were kind of confused.

Over the next few years, Fahrquar kept popping up in the most unusual places. But, unlike in the past, he became more unobtrusive. There was no grinning, no sly looks. We would be at the ballgame at Shea Stadium and for one crystallized moment there would be Fahrquar buying a hot dog at the concession stand. Or, we would be walking down Fifth Avenue and Fahrquar would suddenly appear in the crowd, walking in the opposite direction, and then just as *suddenly* vanish. Once, Jim and I were at the Metropolitan Museum of Art and for an instant that distressed-looking fellow in the sculpture "Ugoiino and His Sons" looked like Fahrquar. Then, on second glance . . . no, of course not.

Fahrquar retired a few years back and Jim and I haven't been as active in ham radio as we used to be. Jim went on to college and sort of lost his interest in the hobby. I continue to write for this magazine, but I'm not on the air nearly as much as I used to be. My job writing about the computer industry and other demands of life have kept me from operating as much as I would like. At best, I manage a couple of hours a month lately. These combined factors seem to have finally removed Fahrquar from our lives. The last apparition appeared at a New Year's party, when Jim and I thought we saw the former prez's face within the bubbles inside a glass of champagne. That may have been the result of too much good cheer, however.

The other night I slipped into my shack and fired up the old Kenwood. Slowly, I brought the tribander around on a direct north heading. The speaker crackled with QRN, and I could barely make out a QSO deep in the background. And for a moment, just a moment, I thought I heard ol' Fahrquar's call. I contemplated giving Jim a ring on the landline to tell him about it, but thought better of it. ■

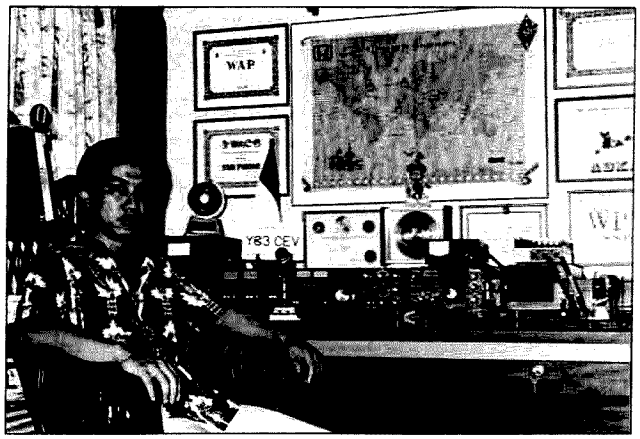
100% QSL RETURNS

Here are a few tips that are the result of my checking into the gripes of many so-called DXers who, after complaining bitterly about their failure to get QSL responses, were found to have improperly executed their cards or had failed to provide return postage.

The Card



Your QSL card should have all of the QSO information and *your* callsign on the same side. If they are not printed that way, write your call conspicuously on the side with all of the information.

It is essential that you double-check your log when entering the date, time (in UTC!), band, and so on. Many "not in the log" replies are the result of errors on the card and the use of local time rather than UTC.

The Procedure

Unless you are QSLing via a bureau, *always* furnish an SASE or an SAE with either IRCs or a dollar bill ("green stamp") to cover return postage. Check the *Callbook* for a list of the number of IRCs required for each country.

The majority of QSL cards are 3-1/2" x 5-1/2" and fit nicely into a 4" x 6" envelope. However, many foreign cards are larger, so you should send a 5" x 7" SAE when QSLing an overseas station. Prepare your mailing like this: Fold the SAE in half and insert it, fold down, in your envelope. If you are including a dollar bill, wrap it in a sheet of carbon paper, fold it in half, and place it in the fold of your SAE (not in it). Tuck IRCs and your QSL card into the fold of the SAE, seal it up, and start filling out your DXCC application.

Yan Bambang YB3CEV at the operating position of his station in Surabaya in Indonesia.

Five of the ops at BY1QH, all of them engineering students at Quing Hau University. Left to right: Chang, Station Master Yuan, Liou, Qu, and Wang. The caps were donated by the W7PHO Family Hour net.

Plata will activate for the first time Trinidad Island from October 20–25. The island is in the Atlantic, 31 miles south of Bahia Blanca. The club has filed a request that Trinidad be added to the IOTA Award list and that their DXpedition be considered the official start date for IOTA accreditation. Look for AZ1D on (CW) 3.510, 7.005, 14.020, 21.020, 28.020; (SSB) 3.690, 7.090, 14.200, 21.300, and 28.600. On VHF, the frequencies will be 50.110, 146.52, and 144.300 MHz. QSLs go to LU2DT.

OH1RY will be on a South Sea Island DXpedition this month: Look for him signing /3D2 on Fiji October 19–22, /T2 on Tuvalu October 22–29 (during the *CQ* WW SSB test), /A35 from Tonga between October 29 and November 5, and /5W1 on Western Samoa from the 5th to the 9th of November. QSL to his home address.

The Bulgarian Federation of Radio Amateurs is celebrating the 60th anniversary of the founding of the first Bulgarian radio club with a special award. To qualify, earn 60 points during July 15th to December 31st, 1986, by contacting LZ6 stations (6 points each) or other LZ stations (1 point each). The award is free; send your logs to BFRA, PO Box 830, 1000 Sofia, Bulgaria.

Our French correspondents are expressing optimism in the assignment of at least one amateur in each of the crews that are now being readied for immediate departure to Crozet and also next month's voyages to Kerguelen and Amsterdam Island. Jim and Kirsti Smith (VK9NS and VK9NL) are assessing new (and apparently less rigorous!) opportunities for another DXpedition to Heard Island in early 1987. ■

The first part of the month will be more unsettled than the last part. Expect an unsettled geomagnetic field through the 5th and again around the 15th. The 20th–21st could also have an active field. Barring development of a coronal hole, you can expect good fall DX propagation, particularly around contest time.

NEVER SAY DIE

Number 20 on your Feedback card

The following, which is in extraordinarily bad taste, should not be read by Extra-class hams—or anyone planning to be an Extra.

KILLER EXTRAS

When the word got out that the Oklahoma mass murderer was an Extra-class ham, someone mentioned that the Atlanta mass murderer had also been an Extra. Hmmm.

Well, I don't think there's ever been any question about hams being crazy—it's just that we've never really figured out whether we become hams because we're crazy or amateur radio makes us crazy. Chicken or egg? We need some serious research, eh? I'll put my money on Morse code as the unbalancing factor. All those dits and dahs could easily flip one out.

Hey, don't get mad at me for breaking the bad news that you're crazy. Crazy is just like alcoholism, smoking, and other insanities—the absolute last one to recognize there's a problem is the crazy. Look, if you think I'm exaggerating just ask any non-ham friend whom you really trust and see if he or she doesn't agree with me that you're crazy.

How else can you explain someone sitting for a lifetime trying to collect QSLs from 325 countries? There's no way to explain that as sane. And how about those of us who talk ourselves hoarse for 33 hours on a weekend trying for a dumb contest certificate? Let's see you come up with a rational explanation for ham contests. Can you explain traffic handling with a straight face? And the loonies bouncing signals off the moon?

Hams get mad when I point out that the CBers who've been arrested and put in prison for using bad language over the air over long periods of time have all been Extra-class hams. How sure are you that it isn't the 20 words-per-minute code test which does it? How else can you explain all of the really outstandingly crazy hams being Extra class? Hey, I'm sure glad I didn't get my Extra! If I'd gotten it I'll bet I'd be out there getting even with some of the people who've done me in the most in life—instead of waiting until the next life to come back and haunt the hell out of them. I intend to come back with a vengeance—none of this wimpy forgive and forget, no sir.

And those who've gone out of their way to screw me and have had the bad grace to die—I'll get those bastards when I get there. Watch out Jim Fisk. Watch out Clay Pool. Watch out Budlong. And watch out you who have swiped my more treasured possessions. Watch out all you who have it coming—and you know who you are.

Hey, what with time being different in the next world, I may even be able to get started on readers who have let their *73* subscriptions lapse—ARRL directors who have bad-mouthed me in their talks—advertisers who haven't supported *73*. I'll be real busy, but it'll be fun.

A recent *W5YI Report* went on at length with interviews of good ham buddies of N5PS—all telling what a great chap he was. Some of you must know someone good at seances, so how about getting a QSO with Pat and see what he's got to say about the mess he made. Let's hear from N5PS direct and see what he's got to say about this Peeping Tom stuff in the magazines. Hey, I've peeped a couple

Manuscripts

Contributions in the form of manuscripts with drawings and/or photographs are welcome and will be considered for possible publication. We can assume no responsibility for loss or damage to any material. Please enclose a stamped, self-addressed envelope with each submission. Payment for the use of any unsolicited material will be made upon acceptance. All contributions should be directed to the *73* editorial offices. "How to Write for *73*" guidelines are available upon request. US citizens must include their social security number with submitted manuscripts.

Subscription Information

Rates: In the United States and Possessions: One Year (12 issues) $24.97; Two Years (24 issues) $45.47. Elsewhere: Canada and Mexico—$39.00/1 year only, US funds. Foreign surface mail—$45.00/1 year only, US funds drawn on US bank. Foreign air mail—please inquire. To subscribe, renew or change an address: Write to Subscription Department, PO Box 931, Farmingdale NY 11737. Send Canadian changes of address to: *73*, PO Box 1051, Fort Erie, Ontario CANADA L2A 5N8. Return postage guaranteed. For renewals and changes of address, include the address label from your most recent issue of *73*. For gift subscriptions, include your name and address as well as those of gift recipients. For questions concerning your subscription and to place subscription orders, please call us toll free at 1-800-645-9559 between 9 am and 5 pm or write to *73*, Subscription Department, PO Box 931, Farmingdale NY 11737. ***73 Amateur Radio*** (ISSN 0745-080X) is published monthly by WGE Publishing, WGE Center, Peterborough NH 03458-1194. Second class postage paid at Peterborough NH 03458 and at additional mailing offices. Canadian second class mail registration number 9566. Entire contents copyright © 1986, WGE Publishing. All rights reserved. No part of this publication may be reprinted or otherwise reproduced without written permission from the publisher. Microfilm Edition—University Microfilm, Ann Arbor MI 48106. **Postmaster:** Send address changes to *73 Amateur Radio*, Subscription Services, PO Box 931, Farmingdale NY 11737. Nationally distributed by International Circulation Distributors. **Contract:** The mere possession of this magazine is hereby deemed legal proof that (a) you've read this contract message and (b) that you are legally bound to observe the terms of this binding contract. Under Penalty of The LAW you have agreed to make at least one favorable mention during each and every radio contact for the next three months on the incredible improvement in *73*. You have further agreed to enthusiastically urge every radio amateur you meet over the air, personally, via business, or in any other way you devise, to read and subscribe to *73*. If they are ill-mannered enough to try and plead poverty, point out that they think nothing of blowing more than the cost of a subscription at the grocery—and what's the loss of a meal or two compared to the excitement of *73*? You are expected to report regularly to The Publisher via the bind-in and blow-in cards.

Antennas Away

THIS FROM OUR "Talk About A Nice Guy" department: **Ralph Janninl KA1FAA** of **Unadilla/Reyco** dropped us a note describing his company's new antenna give-away program. To encourage established ham radio clubs to sponsor radio clubs in schools, Unadilla will give *new* school clubs a Unadilla 40/80m antenna kit. To qualify, just have your school principal and the president of the sponsoring radio club drop a note to Ralph describing what's going on. There is a catch—the offer is limited to only five new clubs per state per year. You can get in touch with Ralph at Unadilla/Reyco/Inline, PO Box 215BV, Andover MA 01810-0814.

Big Pitch

WE THOUGHT that Unadilla's idea was so good that we came up with our own little pitch. We'd like to see ham radio magazines in every school library in the country (note: that's ham-radio magazines, not *Ham Radio* magazines!), so we've set up a way for you to sponsor a school subscription. For $15 a year—about 4¢ a day—you can be the one who gets the kids in your local school excited about amateur radio. At $15 we're not making any money, but amateur radio could be picking up another youngster. Well worth it, don't you think? To get this going, send us the name and address of the school library you'd like to sponsor. We'll get their subscription going and send them a letter pointing out your generosity. We'll also publish your name right here in QRX as our way of publicly thanking you for your support of your hobby. Send your info to *73* Magazine, Editorial Offices, WGE Center, Peterborough NH 03458.

Camp Kids

OK, WE'RE ON A ROLL with this kid stuff, so let me tell you about a group of hams who got together up at the YMCA's Camp Manito-wish in Wisconsin. Their ninety-minute presentation covered the highlights of our hobby, starting with a quick overview of ham radio history by **Don Kupferschmidt KD9PT**. Don also touched on our new volunteer licensing program and the differences between CB and ham radio. **Jay Van Der Burgt KA9MSR** jumped in next to help demonstrate various modes of operation, with CW demonstrated by **Mike Kurtz AA9Y** and SSB shown by **Jack Peterson KC9NE**. KJ4R and KA9ODM helped out by operating from their homes a few miles away (an exceptionally good idea . . . nothing's worse than standing in front of 100 fidgeting kids calling endless CQs, praying for someone, *anyone* to please, please come back to you!). More quick demos followed with Don describing VHF and repeaters, and packet radio. Finally, a question-and-answer period wrung out the adults with those difficult queries that come only from eager young minds. The point of all this is that taking ham radio to the kids is a heck of a lot of fun, isn't hard to do, and plants that little seed in their minds that, "Hey, isn't this neat? I could do that!" Be sure to send your stories to QRX so everyone can get ideas on how to do this sort of thing.

Calling Canada

WE HAVEN'T HEARD MUCH from our neighbors to the north recently, but rumor has it that the Department of Communications (DOC) is letting hams up there pick their own callsigns. (You have to wonder when things up there get quiet—Garrison Keillor of *A Prairie Home Companion* claims that the Canadians are plotting to invade the U.S. "You just can't trust them," he says. "They're too quiet.") **Bill Leal VE3ACY**, president of the Windsor Amateur Radio Club, mentions in *Ground Waves* that the DOC has everything all set up on a computer, and you tell them what call you want and they just give it to you. He changed from VE3IHB (I can see why!). On our side of the line, it looks as if the FCC will be letting us do about the same thing in the very near future. The FCC will still issue the "official" callsign, but you'll be able to buy any call that you like and use that one on the air. The Feds will have a cross-index of who has what, so they can still nail you with a pink slip if you screw up. Things are in the rough planning stage as this is being written, but when it all firms up we'll have all the details. (I certainly wouldn't mind getting rid of KW1O. Yechh. Wayne says he would pay big money for the call he wants: "W.")

Book Nook

HERE'S YOUR CHANCE to pick up Christmas gifts for everyone you can think of! *73* is back in books; we're kicking things off with two classics: ***The Contest Cookbook*** by Bill Zachary N6OP and ***The Magic of Ham Radio*** by Jerrold Swank W8HXR. The *Cookbook* covers every aspect of amateur contesting, from station layout to equipment to techniques. Separate chapters are devoted to domestic, DX, and VHF contests. This book includes tips from winners on how *you* can be a contender! 170 pages. $5.95. Jerrold Swank's *Magic of Ham Radio* is filled with the excitement of amateur radio—stories of daring rescues and life-saving communication. This is a book you'll want to give to your friends when you want them to become interested in ham radio! 156 pages, $4.95. Send your order to *73* Books, WGE Center, Peterborough NH 03458. Please add $1 to your order for postage.

Hamming it up at Camp Manito-wish. Photo by KC9NE.

Chip Tip

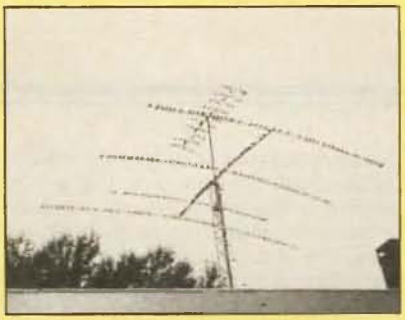
CHUCK HOUGHTON WB6IGP say that some folks are having trouble getting the TDA-7000 chip for his i-f amplifier ("Microwave Building Blocks: The I-f Amplifier," October, 1986, page 42). Chucks says that he has picked up a gross and will sell both the TDA-7000 and the printed-circuit board for the project for $10 postpaid. Get in touch with him at 6345 Badger Lake Road, San Diego CA 92119.

MARC Mark

THE MICHIGAN AREA REPEATER COUNCIL has overwhelmingly voted to move directly to a 20-kHz band plan in the state. Existing repeaters have all been included in the new coordination scheme, although a few sites have some problems. MARC officials expect to have everything resolved and all repeaters in Michigan on the 20-kHz plan by year's end. The council also has elected new officers: **Rod Moag W8NDS** takes over as Chairman, **Jim Brooker NI8E** steps in as Vice-Chairman, and **Paul Englehart KA8BFF** keeps his post as Secretary.

ATIS Onus

THE FCC is looking at a proposal (GR Docket 86-337) that would require an automatic identification of all satellite uplink signals. The system, cleverly called the **Automatic Transmitter Identification System (ATIS)**, would help track down interference in the satellite service, whether it is deliberate or accidental. A unique identification code would be imbedded in every transmitter at the time it was manufactured. Vigilantes like Florida ham Captain Midnight are fairly rare, but it is common for technicians to aim portable uplink dishes at the wrong satellite. ATIS would allow for instant identification of the culprit. Of course, a true hacker out to ax a bird would not worry at all about ATIS . . . he would find some way



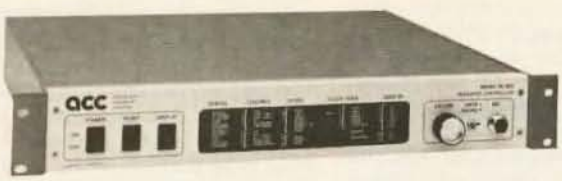
around it. What interests hams about 86-337 is that the FCC is also asking whether *all* radio transmitters should be equipped with ATIS; that includes ham gear. Hmm . . . maybe we could do away with callsigns altogether.

Still III

THINGS LOOK GRIM for our old friend AMSAT-OSCAR 10. Efforts to write a program that could work around damaged areas in memory appeared at first to be successful, but in the past few weeks more problems have surfaced that spell the end of AO-10. The satellite is operating right now in an unpredictable manner; you never know what mode is going to be on when. The mode-B transponder is stuck on, and AMSAT ground controllers have been allowing limited mode-B operation during part of each orbit. AO-10 will be moving into an eclipse period very soon, and unless something drastic happens to perk the bird up, it will not receive solar energy to charge the batteries. There is currently no way to adjust the satellite's sun angle to compensate for the diminished sunlight—once the batteries are dead, AO-10 will be silent.

Contest Code

FREE SOFTWARE is available from **Bill McClellan KV0I** for Commodore C-64 or C-128 owners who plan to operate in the 1987 *73* World SSB Championships. The program is a logger for the contest, and features a fast machine-language duper/sorter, real-time scorekeeping, and hard copy of logs. (We'll be printing the rules for the Championships next month, along with the results of this year's test.) If you would like a copy of the program, send a self-addressed, stamped disk mailer (SASDM?) to Bill at 3304 Jo Ann Avenue, Omaha NE 68123.



"Seems this fellow was hearing a few birdies in his receiver. . . ." Photo by WØRIM.

Fuji OK

AMATEUR RADIO'S newest satellite was launched after a few delays on August 12th. The bird has worn three names, starting life as JAS-1, changing to OSCAR 12 after launch, and now rededicated **Fuji-OSCAR 12 (FO-12)**. Japanese spacecraft are christened with a flower's name when they start operation in space; Fuji is the Japanese word for wisteria. Early users report that FO-12 is very sensitive, easily accessed with only 100 Watts erp. Mode-JA uplink is from 145.900 to 146.000 MHz, with the downlink falling at 435.900 to 435.800 MHz. The transponder inverts uplink signals: To calculate a downlink frequency, subtract the uplink frequency from 581.800. The beacon is at 435.797. JARL recommends that CW be used in the lower third of the passband (435.800–435.835 MHz), with SSB in the upper third (435.865–435.900 MHz) and mixed CW/SSB in the middle third. The digital transponder, mode JTD, is currently being tested and should be running by the time you read this. For tracking information, get in touch with AMSAT at PO Box 27, Washington DC 20044.

Done

That's a wrap for this issue. We had input from *The W5YI Report*, *Amateur Satellite Report*, *The Westlink Report*, and John Hackman WB4VVA. We're always looking for fun stuff to run; send your news to *73* Magazine, WGE Center, Peterborough NH 03458, Attention QRX. Slip a twenty in the envelope if you *really* want your item published (just kidding, Wayne . . .). Oh, you can also send things via CompuServe at 70310,775, or via MCI Mail at WGEPUB.

The RC-850 Repeater Controller . . . when only the best will do.

With an RC-850 controller, your repeater becomes fully remotely programmable – command codes, timers, autodial numbers, ID and tail messages . . . virtually every parameter can be easily changed. Touch-Tone programming from your radio or the phone with synthesized voice confirmation.

The patch supports local and radio-linked remote phone lines, so you can extend your patch coverage to match your RF coverage. Now you can have a full featured patch even if you can't get a phone line at your site. The 250 autodial slots meet everyone's needs, with up to 35 digit storage for MCI/Sprint.

The easy-to-use mailbox lets you include phone numbers, times, or frequencies as parts of messages. And it's so smart, it'll leave you a message if you miss a reverse patch or an alarm.

Selective call capabilities range from two-tone to numeric display paging, so you'll always be available. And its voice response metering continuously stores low and high readings – so you can find out how cold it gets, how high the reflected power reads . . . and *when*.

Individual user access codes, with callsign readback, give you *secure* access to selected functions to completely prevent horseplay.

Advanced Computer Controls continues to lead the way in advanced repeater technology, changing the face of amateur repeaters every day. ACC controllers offer users, control operators, and site managers features and tools to make operation more convenient, useful, and FUN!

The industry's top-of-the-line controller – for *your* repeater.

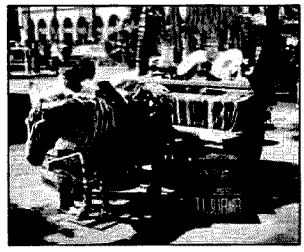
NEVER SAY DIE

from page 4

times—I just haven't passed my 20-wpm test.



Yep, I peeped. Well, I have to tell you it was fun. That was back when I was 12 and in the Boy Scouts. After patrol meetings our group would go out and peep in ground floor apartment windows. The head peeper patrol leader would gasp in amazement, naturally driving the rest of us to peek. We'd gasp too. The fact is I never saw anything. But education is what the Boy Scouts is for, isn't it? And what better sex education than a good peep at the right time. It's just our timing was bad.

Now this camouflaged suit business is a real tipoff. Something extra has to be wrong with people who wear camouflaged T-shirts—sox—hats, and that nonsense. You show me an Extra-class ham in a camouflage suit and I'll show you some real running speed. Where's my bullet-proof vest—the one I wear to ARRL conventions?

I say let's stop this carnage. Let's petition the FCC to stop the 20-wpm code test before it's too late and we drive more innocent hams over the edge.

SAN DIEGO

The ARRL National Convention this year was in San Diego in early September. Though there weren't many exhibitors, the event sure brought out the local hams—very good attendance. I heard some estimates of 5,000. This is surprising for California. The weather couldn't have been better.

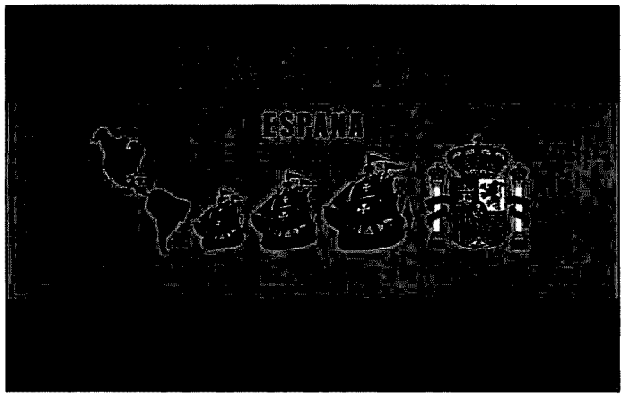
To celebrate W2NSD's visit to Tijuana during the ARRL National Convention, every donkey in the city was painted to look like a zebra.

Since I got on the speaker's list late, all they had left open was Sunday morning—sure death for a speaker. Well, the room wasn't packed as usual, but an estimated 300 turned out—astounding for Sunday morning. Even more so when you know the hamfest only ran from 9 to 12 on Sunday and my talk was from 10 to 12!

One of the problems with talking at such a difficult time is that I find I'm preaching mostly to the converted—the hard-core Wayne Green fans. If we're going to get amateur radio growing, I've got to get more hams to read *73*—so I need to reach the Wayne Green haters—and, even more, the apathetic, many of whom don't read *73* and haven't even heard of me.

Maybe you have some ideas on how I can get more hams to read *73*. Unless a lot of readers are lying to me, I've perked up the magazine so it's fun to read again—more fun than any other ham magazine—which, alas, isn't very difficult. When I send letters to the *Callbook* list I find that about 98% of the hams just throw my letters away. I don't even know if they open them. Talk about depressing! So maybe you have some ideas?

Look, if you want to get a 300-page magazine every month—packed with construction articles, hot news on packet, international news, and so on, it's going to take 120 pages of advertising. That's a fact of publishing life. And that doesn't put me on easy street, that's just in order to break even.



Now, how do we get 120 pages of ads the way we used to a few years ago? First we have to have about 120,000 paid readers. The rule of thumb is that a magazine should be able to sell about one page of ads for every thousand readers. So if we can double the number of *73* subscribers, I think we'll be able to turn out some 300-page magazines for you and make *73* as exciting as it was around five and ten years ago.

So what do you suggest I do to get your friends to subscribe? It'll help if you try not to keep a total secret of how much you enjoy the magazine now. It won't hurt if you bring up the matter of getting club members to subscribe at club meetings. I even have some attractive group subscription deals for clubs.

Just having 120,000 readers won't magically get us 120 pages of ads. I'm going to need a good deal of help here, too. Many firms are so brainwashed about *QST* that they'll go out of business never even trying their ads somewhere else to see if they'll bring more sales and save their companies. You can help here by beard-ing them at hamfests and telling 'em you're looking for their ads in *73*. If you happen to correspond with them about something, mention it.

73 has the most lively bunch of ham readers of any ham magazine—our advertisers constantly tell us their ads pull sales much better from *73* than anywhere else—yet even though it's costing 'em thousands of dollars in sales—cash money out of pocket—I see many ham firms not even giving us a chance to show how we can build their business.

The advertisers put a lot of store in the Reader Service requests we

QSL OF THE MONTH

To enter your QSL, mail it in an envelope to *73*, WGE Center, 70 Rte. 202 N., Peterborough NH 03458, Attn: QSL of the Month. Winners receive a one-year subscription (or extension) to *73*. Entries not in envelopes cannot be accepted.

Wayne Green Enterprises is a division of International Data Group.

73 Amateur Radio (ISSN 0745-080X) is published monthly by WGE Publishing, Inc., a division of Wayne Green Enterprises, Inc., WGE Center, Peterborough NH 03458-1194.

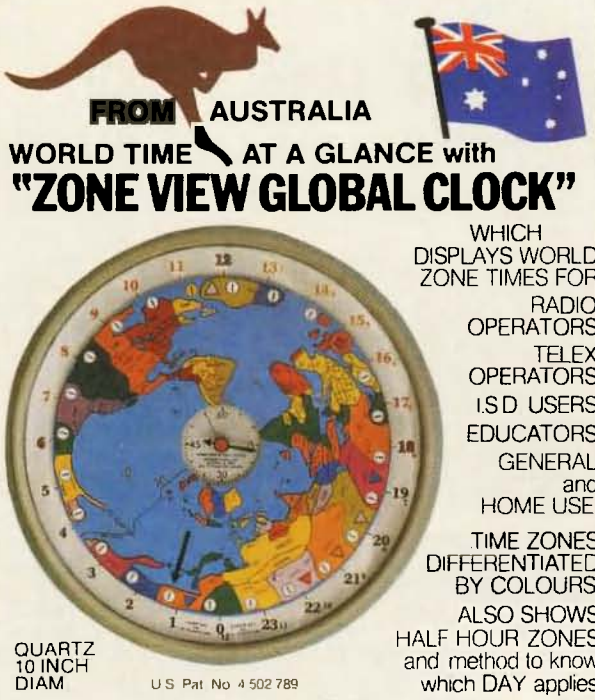
Entire contents © 1986 by WGE Publishing, Inc. No part of this publication may be reproduced without written permission from the publisher.

pass along to them, so make sure you send for information on any product in which you're interested. They also have to make sales in order to stay in business, so don't jerk them around.

If you get to any of the major hamfests, you know that the bulk of the firms selling products to hams are small and run by hams. Indeed, no one else would bother to try to survive in such a dying market. In the past, a large part of the sales of ham gear was to newcomers. These days, with newcomers dropping more and more every year, much of those sales are gone. That leaves us with a relatively small group of active hams—plus a raft of semi-active—the hams who have been rag-chewing for years with the same old gear—talking with the same people year after year.

DXers and contesters have to keep more up to date or else they fall behind. We're seeing most of the top DXers and contest hams using the newest computer-controlled rigs—putting up newer and better antennas every couple years—using a computer for log and record keeping.

The chap in the booth next to *73* had a corking good program for working the Sweepstakes contest—a contest I always used to enjoy. It keeps track of every contact, checks for duplicates, let's you know what sections have been worked and which are still needed, and so on. It sure would have made my contesting a lot easier to have an aid like that at hand!



W2NSD/ZF groping for grouper in Cayman Brac.

Speaking of contests, it's getting on time for someone with contest experience to write some instructions on how to win contests. Contests are won, for the most part, by hams who thoroughly believe that winning isn't just important—winning is everything. So I'd like to see helpful hints on winning contests—like how to leave openings in your log for the later insertion of normal-looking mythical stations from missing sections or countries. After all, the contest log checkers can't verify everything, right? So if you put in some calls you know, but which you didn't hear during the contest, who's to know? It's despicable to win a contest certificate by such scurrilous skulduggery, but unless we let everyone know the contemptible techniques used by some of the high scorers who seem to have forgotten that amateur radio is a hobby—for fun—they'll be at a serious disadvantage. Only by bringing such treachery out in the open can it be thwarted, so let's have some facts on how some conscienceless hams have been screwing their more honest fellow hams.

One of the more fun aspects of the hamfest was the hospitality suites after the show closed. The 10-GHz group outdid everyone else with a bluegrass band—Gerry Earl N6LYX lead guitar and singer. Of course I'm a sucker for bluegrass music anyway. I've been increasingly upset that no bluegrass has yet come out on CD (at least that I know about). I wonder how many ham bluegrass groups there are out there? I'd sure like to find one in each city where there's a major hamfest so I could organize a hospitality room, complete with a small band.

My good friend Chuck Martin WA1KPS, who used to run Tuft's Electronics, plays a mean blue-

grass guitar. It made the drive from Denver to Aspen go quickly as we sang our way across the mountains on our yearly ham industry skiing trip there. I think we'll be hitting Aspen again this January—HTs tying us together as we ski the different areas.

I wish a group in San Diego would get a yearly hamfest started so it could build up attendance. You don't get a big pull the first year or two—these things have to build up.

San Diego isn't far from L.A.—has perfect weather—it could do well as a yearly hamfest site. It's got plenty of interesting things to see—such as Old Town, Tiajuana, and the famous San Diego Zoo. Let's do it again.

The Las Vegas hamfest in November looks as if it will be a yearly affair, so I'm rooting for it. The chap running it has lots of good ideas and needs all the cooperation he can get. The old Saroc hamfest built up for a while, but then was killed off by what I saw as extraordinarily poor management. I know I got lied to and shafted—and I heard from others with similar problems.

By having the hamfest just before Comdex, it should pull in not only those California hams who enjoy a couple of days in Vegas, but get the computer industry hams to come a couple days early—and there are a whole lot of hams in the computer business.

THROW YOURSELF INTO THE VOLCANO

It's getting time for some human sacrifices if we're going to save amateur radio. It's a drought and the crops are dying. How about you—are you willing to sacrifice to help stop the bleeding?

A letter from Ed WB6IDP had a good suggestion. One of the reasons we're losing more and more hams every year is that such a high percentage of Novices aren't making it to Tech or General. If we could improve the percentage of Novices who stay with us, we might at least break even and stop falling behind.

If we can get Novices to increase their interest in amateur radio, we stand a very good chance they'll infect some of their friends with their enthusiasm and help us get more Novices. This goes particularly for the 15% of the newcomers who are teenagers—the ones we need most to reach.

Okay, how can we get Novices to stick around? Well, one simple way is to make sure they find amateur radio fun. Novel thought, eh? Now let's have a show of hands—how many of you have worked a Novice in the last two months? Humph, I thought so. You're so damned busy rag-chewing you haven't any time to try and make life more fun for Novices. What the devil do I have to do, start a contest and give certificates to bribe you to do your civic duty and put in some time with your key and help our Novices have some fun?

Let's be honest about this now . . . you're probably going to have to do some code practice to get your speed up to five per so the Novices won't embarrass you. If I had it my way every ham who insists on our keeping the code test would have to be tested every year at a minimum of 35 wpm. So get out your code tapes and spend a few weeks getting your speed up to 5 wpm and then get on one of the Novice bands and be nice. None of this QLF crap, okay? I can't tell a D from a TI when you send it, you know. Bad when you have the DTs. Let me know how long it takes you to figure that one out.

Rather than tell the poor Novice about that old rig you're using, I suggest you look up one of the modern ones in *73* and just tell 'em you're using one of those. After all, the chances are your rig was made before the Novice was born and he's never heard of it. Once the ARRL gets their new $6 million museum up and running, Novices may get to be more familiar with your gear.

I'll bet you thought I was going to be critical of the League for putting so much into a museum instead of investing it in promoting the growth of the hobby. Nope, not me. I think they see amateur radio about to crash in the near future, so the best possible investment will be a museum so later generations will be able to know there once was something called amateur radio. Good move. I've got some first-class stuff I might donate . . . been wondering what to do with it.

I can hear the consternation now as Extra-class ops ask each other where the Novice bands are. Anyone got a *Callbook*? Maybe there's a frequency chart in there. How about the *Handbook*? Hmmm, I wonder if my 1955 edition is still okay to use? I don't see any point in buying the damned things every year.

LETTERS

Number 18 on your Feedback card

THE FIRST

J. L. Reinhartz did not originate the feedback circuit shown on page 68 of your September issue ("Kit Corner: Build a Two-Tube Receiver"). The first article covering the use of a fixed "tickler" for feedback and a variable capacitor for ease of control was the lead article in the December, 1919, *QST*. The author was "Donald F. Alexander, radio 1BK." I had just received license 1BK on October 1, 1919, but had been building receivers for two years.

The editorial box at the top of the article said, "This article is a description of a tickler-feedback set, and is destined, we believe, to be popular.... Receivers containing variometers are difficult of construction in the home workshop. Mr. Alexander's set is a cinch...."

My mother once told me of my father, "Son, your father has now an incurable disease...it is called the plague of total recall." So forgive me, too.

Don F. Alexander W8LK
Dayton OH

Forgiven. And, unfortunately, forgotten.—KW1O.

OUT OF TOUCH

In response to the August, 1986, Letter "AM-ATEUR RADIO":

Writers submit AM articles only to publishers interested in publishing AM articles; therefore you never see any at *73*. If you never read any then it must be by choice because there are plenty out there.

Ever wonder why new transceivers have an AM mode? Is it because manufacturers are out of touch, or could it be that publishers are out of touch?

W6RNC is not stuck in the hobby of 40 years ago as you stated. He is 10-20 years ahead of his time. And don't feel sorry for W6RNC, feel sorry for yourself because you're the one missing out.

One final note. Get your equipment this year. The cost of the old gear is going up, up, up.... No one is making it any more, and once it's gone it's gone forever.

Art Rideout WA6IPD
Fallbrook CA

There seems to be a problem here. We don't publish AM articles because we don't get any; you don't send any in because we don't publish them. Believe me, 73 will survive a lot longer without AM articles than AM will without articles in 73. So the burden is on you and the AM community to come up with some interesting projects to send in—and I promise you that 73 will publish any article we think is worth reading...even if it's about AM.—KW1O.

FUNNY PAPERS

For years now I've been trying to promote ham radio to the younger generation; I just keep failing. Let's face it, the Japanese influx of computer games, cheap computers, and chicken band gear is hard to compete with. I sometimes think that the Japanese obsession with monster movies some years back was prophetic...they're likely to become the monster that ate the world.

Kids are highly impatient—they want it now. Kids aren't going to plunk down $300 for some used gear if they don't have any interest. To generate this interest, they need the rig. Catch 22.

Young minds are innovative. If you can spark their interest, they soon find ways to get the money for bigger and better things. Home-brewing tends to foster basic skills and insights that appliance operators never will develop. I have known graduate engineers in our electronics industry who didn't know how to solder. This is how the Japanese got the ball from us and are running with it. Newington's answer to all this is a comic book. It is comic in more ways than one. The best it can hope to do is generate more appliance operators.

George Hermann N9BNH
Chicago IL

George, I agree with you that home-brewing is a great way to develop electronic savvy. However, we're looking at a hobby that's changing...and holding on to the "old ways" just won't cut it anymore. There's nothing wrong with being an appliance operator; after all, the goal of ham radio is to communicate, not to sit around building transceivers. Giving Novices voice privileges is a good first step. Now let's push to drop the code requirement from the Novice license and really *start communicating!—KW1Q.*

DOWNHILL

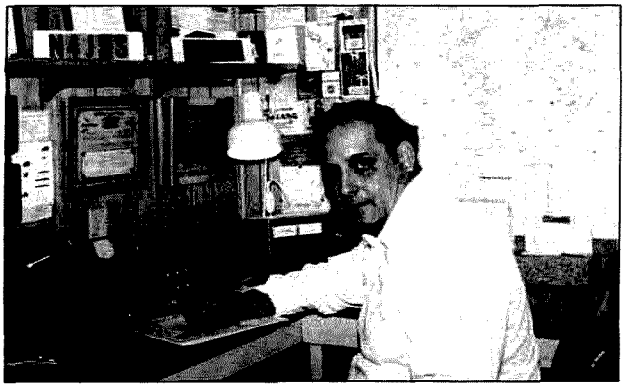
I believe that a high priority in the program to get amateur radio growing should be to prevail on the FCC to not discriminate against our young people, presently licensed as Novices or planning to become hams, in not allowing A3E in the proposed new "enhanced" Novice 10-meter phone band. I would like to remind the people at the ARRL who proposed this that this hobby of ours would not have grown as it did without a mass migration of us old-timers to 160-meter phone (AM) operation in the early 30s.

The reason the hobby is going downhill today is that our ham magazines no longer publish articles on how to build your own simple gear for a first station setup. The big bucks cost of the rigs presently advertised is out of reach for the majority of young people who might consider sweating out the Novice license requirements. With availability of the information and parts to build one's own gear, these people would be interested in becoming hams. The problem here is to turn around the present situation so local parts suppliers can get back into business to supply this group of prospective hams.

Irving Megeff KD2EF
Flushing NY

The cost of ham equipment is about the same as that of a stereo, or a home computer, or a dirt bike. Price is not the problem. Showing kids how to build a station out of a scrap TV won't help, either—at best they'll get a QRP transmitter that barely gets out of the yard and a junky super-het receiver to match. Big deal. What we need is to get kids talking to each other, and that means starting up clubs in every school in the country. That's *our high-priority program.—KW1O.*

OLD FRIENDS



Wayne: Here's a note to bring back some memories of your visit to Aqaba, Jordan.

Our family met your family during one of your many trips overseas. It was my pleasure that you used my rig to make some QSOs from our QTH. I really wished you could have stayed longer, as there were a million questions I thought of asking...after you and your wife had gone.

Anyway, I'm back in the U.S. now, operating as N4JFS instead of the pileup-grabbing JY9CW, and I'm beginning to feel like a small pea in a very large pot—it's terrible being a has-been. How about an uplift, Wayne? It would do me wonders.

Matt Barbani N4JFS/JY9CW
Vienna VA

Of course I remember my visit to Aqaba and getting on the air from your station. And sure, I'll see if I can't get your picture in 73. That should give you some attention on the air. I had a great time at Aqaba—particularly the birthday party you took us to—and the scuba diving in the Gulf of Aqaba with HM's equipment.—Wayne.

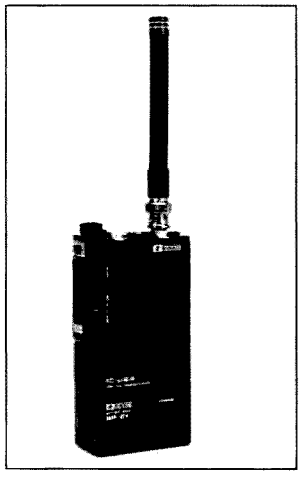
Matt Barbani N4JFS/JY9CW.

NEW PRODUCTS

Number 21 on your Feedback card

DIAMOND SYSTEMS HAM TESTS

Diamond Systems has introduced a computerized self-testing study guide for IBM and Apple computers. Separate tests are available for each class of license. The program provides automatic random selection of questions from the appropriate question pool and keeps a running count of the total number of questions answered, the number of wrong answers, and the percentage of correct answers.



The Novice test is $24.95; all other tests are $34.95. For more information, please check Reader Service number 206.

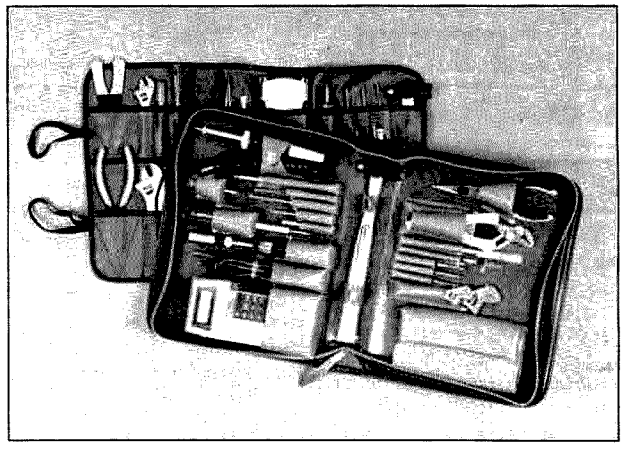
TWO NEW ICOM HTs

ICOM has released the 220-MHz counterpart to the popular IC-02AT and IC-04AT hand-helds. The IC-03AT features coverage from 220–224.995 MHz, an LCD display, a DTMF pad, 2.5 Watts rf out, 10 memories, memory scanning, programmable scanning, and 32 built-in subaudible tones. The IC-03AT comes with an IC-BP3 rechargeable battery pack, an ac wall charger, a belt clip, and a wrist strap.

The second entry is ICOM's IC-μ2AT pocket-sized 2-meter handheld. The Micro covers 139–174 on receive, and transmits from 140–150 MHz with 1 Watt output (1.5 Watts with an optional battery pack). Other features include ten memories for storing frequency, offset, and access tone information; an LCD display on the top panel; scanning; and 32 built-in subaudible tones.

For more information, please check Reader Service number 213.

ICOM's new pocket-sized IC-μ2AT.



JENSEN TOOL KIT

Jensen Tools has introduced a new kit featuring tools for troubleshooting, servicing, and repairing all types of electrical and electronic equipment. Designated the JTK-84, the kit includes screwdrivers, nutdrivers, hex and spline drivers, pliers, cutters, wrenches, a hammer and punches, soldering equipment, and more. The kit is available in a vinyl zipper case or in a vinyl roll-up pouch that fits in a tool case or desk drawer.

For more details on this and other Jensen products, check Reader Service number 210.

KENWOOD R-5000

Kenwood has released information on its new R-5000 HF/VHF general-coverage receiver. The R-5000 looks similar to the TS-440S and features full coverage from 100 kHz to 30 MHz; additional coverage from 108–174 MHz can be had with the optional VC-20 converter. The receiver's 100 memory channels store frequency, mode, and antenna selection information. Other features include Kenwood's DynaMix™ system for a 102-dB dynamic range, dual digital vfo's, direct keyboard frequency entry, a built-in power supply, and dual 24-hour clocks with timers. Accessories include a voice synthesizer, a computer interface, and a variety of filters.

Jensen's JTK-84 tool kit.

For complete specifications, check Reader Service number 207.

TORONTEL SSTV SYSTEM

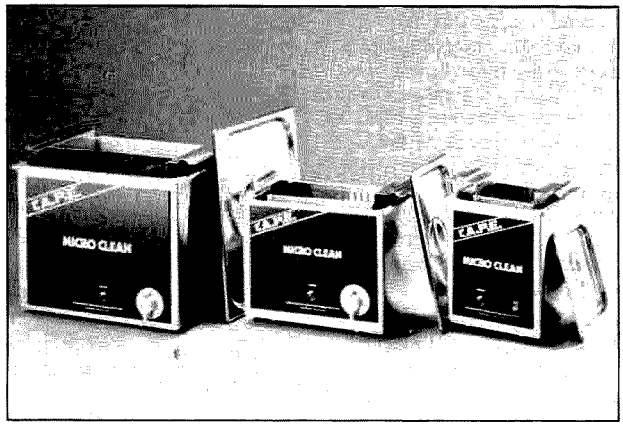
Torontel Technology Systems Graphics Environment for Slow-Scan Television (GEST) is an icon-oriented software package designed to marry the power of an IBM PC to Robot's 1200C color scan converter. GEST gives the SSTV operator a palette of over 250,000 colors (65,000 colors can be on the screen at any time), animation, image manipulation, image editing with over 20 functions, software signal processing and filtering, and a full 1200C control panel on the computer screen.

For complete information, check Reader Service number 208.

APE MICRO-CLEAN

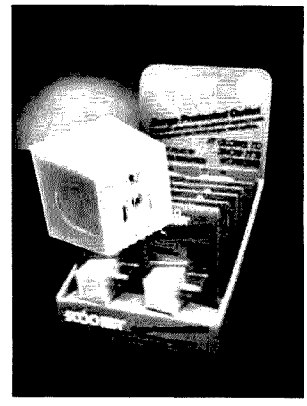
Automated Production Equipment has announced a complete line of ultrasonic cleaners for the electronics industry. The A.P.E. Micro-Clean is available in sizes from 2 to 11 quarts, with prices running from $249 to $525. The cleaners are also available with custom-fitted covers, baskets, and trays.

For more information, please check Reader Service number 211.



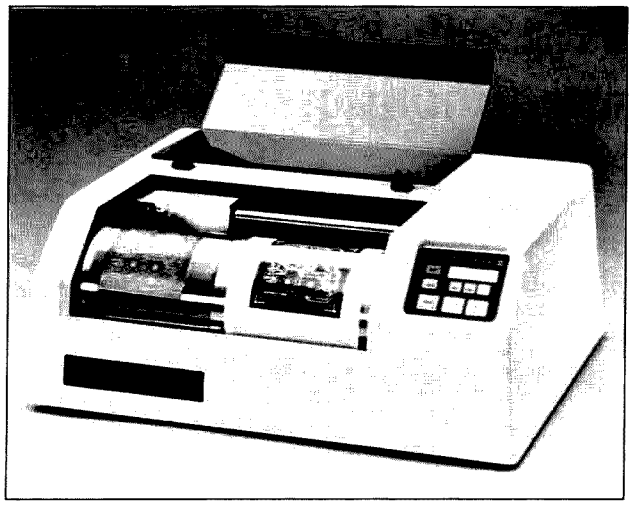
KAUL-TRONICS MESH ANTENNA

A new mesh satellite antenna, ideal for use on patios or other restricted areas, has been introduced by Kaul-Tronics. The Trans-7 is compatible with both C-band and Ku-band systems. Adaptable to either a patio mount or a polar mount, the black mesh antenna has an f/D ratio of .39 and a focal length of 33 inches. Gain is 37 dB on C-band and 43 dB on Ku-band.



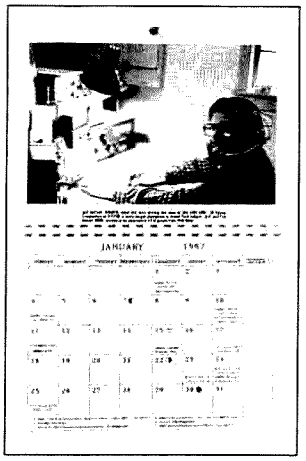
For additional information on Kaul-Tronics antennas, check Reader Service number 212.

SCOOTER SURGE PROTECTOR



Ohm/Electronics has introduced its new Scooter™ model SP-100 Guard-It single-outlet

A.P.E. ultrasonic cleaners.



Single-outlet surge protection from Ohm/Electronics.

The Girard Protoflex-III printed-circuit system.

Free tool catalog from Jensen.

KB1T's ham radio contest calendar.

surge protector. This 125-volt, 15-Amp line-protection device plugs into any three-prong wall socket and glows to show that it's protecting your equipment against voltage surges. Use it to protect microcomputers, monitors, VCRs, radio gear, stereos, and so on.

Suggested retail price is $9.95. For more information, please check Reader Service number 214.

GIRARD PROTOFLEX-III

Girard Electronics now offers a new system for fabricating printed-circuit boards directly from CAD equipment without chemicals. The Protoflex-III model PF-IIIA works from a CAD schematic or line art (film positives or negatives, or patterns from a magazine) and can produce tin-plated copper patterns on a polyimide base at the rate of 75 square inches per hour. The flexible circuit can be laminated onto a double-sided board.

For complete information about the PF-IIIA, please check Reader Service number 209.

DAVLE TECH TOOL CASES

Davle Tech's models TC-11 and TC-15 are rugged, lightweight, vinyl-laminated aluminum tool cases featuring removable tool pallets, aluminum partitions in the bottom, soft handles internally reinforced with steel cable, and a one-year warranty. The TC-11 measures 18" x 12.75" x 5.5", while the TC-15 is 18" x 12.75" x 8". Both models are available with formed polyurethane foam, elastic pallets, or conventional pocket-type pallets.

For more information on these and other Davle-Tech products, check Reader Service number 215.

FREE TOOL CATALOG

A free catalog of tools and test equipment is available from Jensen Tools, Inc. Illustrated in full color, the 160-page catalog contains more than 1,000 items of interest to electronic service technicians, students, and electronics hobbyists.

Two new sections feature supplies and equipment for fiber optics and wire/cable systems. An expanded line of circuit board equipment includes breadboard kits, cutting tools, drill sets, insertion/extraction tools, and test cables.

For your copy of this free catalog, check Reader Service number 217.

KB1T PHOTO CALENDAR

KB1T Radio Specialties has announced availability of the 1987 Amateur Radio Photo Calendar. The 1987 edition is a 32-page spiral-bound book with two pages for each month: A 7" x 10" black-and-white photo of contest action on one page and dates and times for most of the major ham contests on the other. There's also plenty of room for jotting notes and keeping track of schedules.

The calendar is $11.95 plus $1 for shipping in the U.S.; for more information, check Reader Service number 204.

XCELITE CUTTERS

Static-dissipating sleeves, designed to control electrostatic discharges that could damage sensitive electronic components, have been added to the Xcelite® line of stainless-steel diagonal cutting pliers. Made of Benstat®, the sleeves do not contain carbon elements or other agents that particulate or slough. This makes the cutters ideal for clean-room applications.

The sleeves are available on six models of diagonal cutters (112CGSD-117CGSD); all six meet DoD standard 1686 and DoD Handbook 262 requirements for static-dissipating material.

For more details, please check Reader Service number 216.

ALL BAND DIPOLE TRAP ANTENNAS!

PRETUNED-ASSEMBLED ONLY ONE NEAT SMALL ANTENNA FOR ALL BANDS! EXCELLENT FOR APARTMENTS! IMPROVED DESIGN! FOR ALL MAKES AMATEUR TRANSCEIVERS! GUARANTEED FOR 2000 WATTS SSB INPUT FOR NOVICE AND ALL CLASS AMATEURS!

COMPLETE with 90 ft. RG58U-52 ohm feedline, and PL259 connector, insulators, 30 ft. 300 lb. test dacron end supports, center connector with built in lightning arrester and static discharge. Low SWR over all bands -Tuners usually NOT NEEDED! Can be used as inverted V's - slopers - in attics, on building tops or narrow lots. The ONLY ANTENNA YOU WILL EVER NEED FOR ALL BANDS! NO BALUNS NEEDED!

80-40-20-15-10 - - 2 trap - 104 ft. - Model 998 E . $99.95

Number 11 on your Feedback card

There's no doubt that what makes the 220-MHz band "tick" is the large number of FM operators, especially in metropolitan areas. 220 has become a haven from the congestion and chaos of the 2-meter band in these areas. Surprisingly, though, many operators on 220 possess no more than the bare bones—a 220 hand-held radio with 1 to 3 Watts output.

Quite often you will hear one of these operators using that same HT from his car, breaking in and out of the receiver with that same 1–3-Watt power level. After being informed that his signal just isn't cutting the mustard, the purchase of an intermediate power level amplifier is the next predictable step. For the infrequent user of 220, the investment in an HT and amplifier might total more than a 25–30-Watt mobile radio. . . but it does offer more flexibility around the station and in the car.

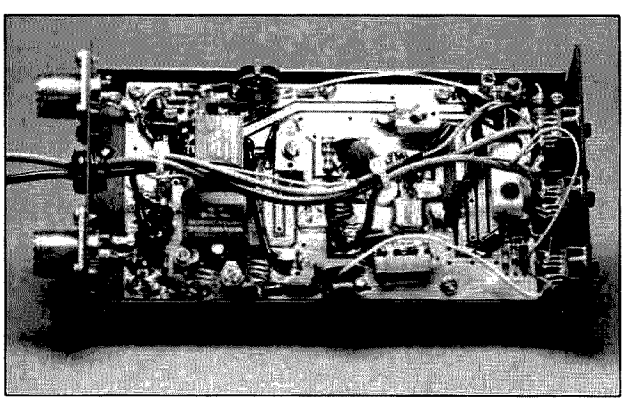
Who makes these amplifiers? There really isn't much of a choice! For the longest time, the only manufacturer of a 25-Watt amplifier for 220 MHz was KLM (now Mirage). The trusty Mirage C22 A (2 W in, 20 W out) has been with us for some time and is a familiar face. I've used one around the shack for about 1 year now for my 220 HTs and have also operated mobile with it on numerous occasions.

But now there's a newcomer to 220 FM. Alinco Corporation of Nevada has introduced the ELH-220GF 20-Watt amplifier with GaAs-FET preamp and rf-sensed switching, all in an attractive package about 6" x 3" x 1". It is designed to take up to 3 Watts input for as much as 30 Watts output, making it attractive as a mobile or auxiliary base-station amplifier. This also puts it in head-to-head competition with the Mirage C22 A! How do the two units compare in performance? Let's start with the Alinco.

Appearance

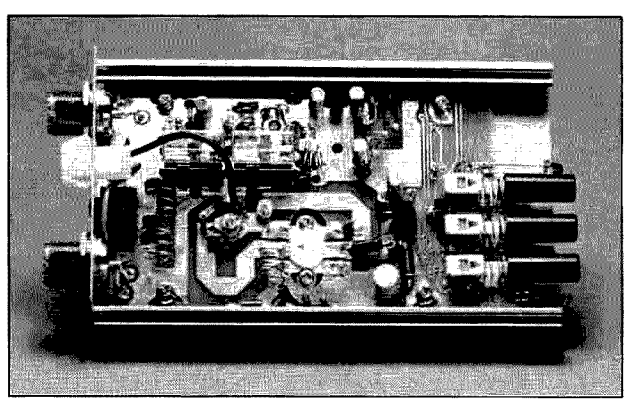
The case is attractively designed and the controls easy to use. From left to right, they are: MODE (SSB or FM), RX ON/OFF, and TX ON/OFF. The MODE switch selects the time constant for relay dropout between words on SSB (on FM, it is instantaneous). The other controls are self-explanatory. The rear panel uses a 2-pin connector for dc, as opposed to the Mirage C22 A which has permanently wired power leads. Two SO-239 jacks are provided for input and output connections.

The Mirage unit comes close in size, roughly 6" x 3" x 2". It also has three controls on the front—POWER ON/OFF, SSB/FM, and PREAMP ON/OFF. These function the same as their counterparts on the Alinco. Again, two standard SO-239 jacks are employed for input and output connections.



One comment worth noting here: I much prefer the conventional four-hole flange type SO-239 used on the Mirage rather than the single hole threaded type used on the Alinco. Why? Repeated connecting and disconnecting of the cables to the Alinco can cause the nut holding the connector to come loose and it might rotate in the hole. Use of the flange type connector by Mirage eliminates that possible problem.

Both units employ LED indicators to show that the receive preamp is on. The only other LED on the Mirage indicates that 13.8 V dc is present. The Alinco shows this as well but also provides LED indication when actually it is in the transmit mode. Amplifiers are frequently under a seat or in the trunk, so it's a moot point.



Performance Tests

Now on to the hard numbers. Both units were tested with the usual Hewlett-Packard 8640 RF Signal Generator and 8554 Spectrum Analyzer combination. Table 1 shows transmit linearity—that is, what level of output you could expect for a given input level. Both amplifiers nominally operate at about 10 dB of gain for a given input signal, and the results seem to reflect just that. The Mirage appeared to saturate at about 22 Watts output, while the Alinco reached saturation at 32 Watts output. (Final stages in each amplifier are: Mirage—MRF204A; Alinco—2SC2540.)

Both amplifiers compress (1-dB compression point) at about 2 Watts input. Gain falls off after this drive level on both amplifiers, but the Mirage falls off abruptly, while the Alinco con-

Interior view of the Alinco ELH-220GF.

Input Level	Alinco Output Power (W)	Mirage Output Power (W)
50 mW	1	1
100 mW	2	2
150 mW	2.5	3
200 mW	3	4
250 mW	4	4.5
300 mW	4.5	5.0
350 mW	5	5.5
400 mW	5.5	6
450 mW	6	6.5
500 mW	6.5	7
550 mW	7	7.5
600 mW	7.5	8
700 mW	8	9
800 mW	9	9.5
850 mW	9.5	10
950 mW	10	12.5
1 W	12	13
1.2 W	14	15
1.5 W	16	17.5
1.7 W	18	18.5
2.0 W	20	21
2.6 W	24	22
3.2 W	26	
4.0 W	28	
5.5 W	30	

Table 1. Input power vs. output power comparisons. The Mirage unit reached saturation at 22 W out. The Alinco unit reached saturation at 32 W out.

tinues to provide almost 10 more Watts of usable output. Overdriving the Mirage results in no additional output but current consumption continues to rise (?).

Spectral purity is comparable in both units, and they meet FCC specifications regarding spurious and third-order harmonics. As far as current consumption is concerned, the Alinco is more efficient—it draws but 3.1 Amps at 20 Watts output; the Mirage requires 4.7 Amps to deliver the same power output.

Since both units employ COR circuits for rf-sensed keying, a logical number to measure is COR sensitivity—otherwise known as the lowest level input signal required to "trip" the COR circuit and put the amplifier in line. Here the Mirage wins out, for it required less than 50 milliwatts of rf to switch on. The Alinco is a bit more insensitive and needs about 100 milliwatts. However, either level is easily below the typical "low power" setting on the average hand-held.

On to the preamplifiers! One gripe I've had in the past with outboard power amplifiers is the poor performance of the preamplifiers that come with them. (So far, the best I've seen have been the Microwave Modules preamps using GaAsFETs and high-performance MOSFETs.) Table 2 shows how the two preamps stack up against each other. Note that while we are sort of comparing apples and oranges—each preamp uses a different type of device, GaAsFET vs. MOSFET—the results are surprisingly similar!

The GaAsFET in the Alinco measured out at 10 dB gain up to an input level of −4.5 dBm, at

	Alinco ELH-220GF	Mirage C22 A
Gain	10 dB	9 dB
1-dB Compression Point	+4.5 dBm	+10 dBm
Minimum Discernible Signal in 1-kHz Bandwidth	−122.1 dBm	−120 dBm

Table 2. Here's how the two preamps stack up against each other.

which point the output started to drop off. This number (called the 1-dB compression point) would be considered fair for a GaAsFET. (A 1-dB compression point of 0 dBm would be good, and above that excellent.) The MOSFET in the Mirage measured out to 9 dB of gain up to an input level of +1 dBm—much better performance.

What does this mean to the average user? With a higher 1-dB compression point, the preamp exhibits better linearity and less tendency to compress and "crunch-up" in the presence of a strong signal. Such compression can result in the generation of secondary and tertiary spurious signals as well as mixing products at the preamplifier's output. In this case, it would be less of a problem with the Mirage when operating in the presence of a very strong adjacent channel signal.

Both preamplifiers exhibited better than average sensitivity. The Mirage was able to resolve a signal of −120 dBm in a 1-kHz bandwidth measured on the spectrum analyzer. The Alinco did slightly better, resolving a level of −122.1 dBm in a 1-kHz bandwidth. With these numbers, I wonder why Alinco bothered with the GaAsFET, as a well-designed MOSFET would have done as well.

Operating Impressions

Both units were tested in my Honda Civic over a one-week period, using a direct connection to the battery through #12 wires. The driving sources were alternately a Kenwood TH-31AT and an ICOM IC-3AT. In all cases the antenna used was a Larsen 220-MHz magnetic-mount 5/8-wave gain antenna.

One problem that both units exhibited occurred when the TX power was on and the RX switch (preamp) off, as I transmitted on 2 meters using my Kenwood TR-7400A. The COR relays chattered furiously in the presence of high rf power (25–30 Watts). Why this happened, I have no idea. Possibly rf was picked up from the 2-meter antenna's coax and coupled into the dc power leads of the amplifiers.

Both the Mirage and Alinco performed reliably. In many cases, the preamps proved to be a boon, as 220-MHz propagation changes can be quite abrupt, resulting in rapid picket-fencing on weak signals. The preamps alleviate this to a great deal, and don't appear to exceed the transmit coverage. In all cases I employed FM mode, so the keying was always solid. I tested both units off the bench with a low-level SSB signal using delayed drop-out keying, but still prefer hard keying in SSB or CW mode. Neither amplifier offers this option, though.

The two units are so small you can tuck 'em away almost anyplace—real important in the smaller imported cars. If you choose to use them while mobile, I'd suggest making up a pigtail out of RG-8/X from your HT to the amplifier, and use a 90° BNC connector on the HT to allow the cable to swivel, reducing strain on it. Avoid 1/4-wave or multiples thereof in the length; aim for 1/2- or full-wave multiples. Although both amplifiers exhibited a good impedance match at the input (better than 1.3:1), it can't hurt and might squeeze a few more Watts out.

Drumroll

Now—the envelope please. And the winner is . . . Alinco, but by the slimmest of margins. It all came down to this: The Alinco could be driven with up to 5 Watts and delivered 30+ Watts for the effort, while the Mirage mysteriously leveled off above 2 Watts drive. While the Mirage had the better preamp, the ultimate criterion for making the decision is how well the amplifier amplifies. In almost every other department the two units came up almost even.

Dick Smith 100-Watt VHF Amplifier Kit

by Allan J. Perrins WB6PHE

Dick Smith Electronics
PO Box 8021
Redwood City CA 94063
Price class: $150

Number 12 on your Feedback card

Sometimes a little more power is all that you need to access a distant repeater or to make that DX contact. How about a lot more power—say 110 Watts or so for 10 Watts in? Need more mobile power with your hand-held? Would 43 Watts out for 2 Watts in make a difference? If you're willing to save a few bucks by spending a few hours with a soldering iron, the Dick Smith 100-Watt VHF amp kit will definitely fill the bill.

Appearance

The completed unit looks very professional. In fact, the only external giveaway that it is a kit will be the lack of pop-rivets holding the case together! All case parts are black anodized, as is the large heat sink (the photos are of a prototype, which had aluminum panels). Front and rear panels are silk-screened with control and connector nomenclature. Rubber feet are provided for base-station use, but as usual with amplifiers, no provision for mobile mounting is made. Fortunately, no parts mount to the bottom of the case and it may be drilled for mobile use. UHF connectors are provided for transceiver and antenna connection.

Circuit Analysis

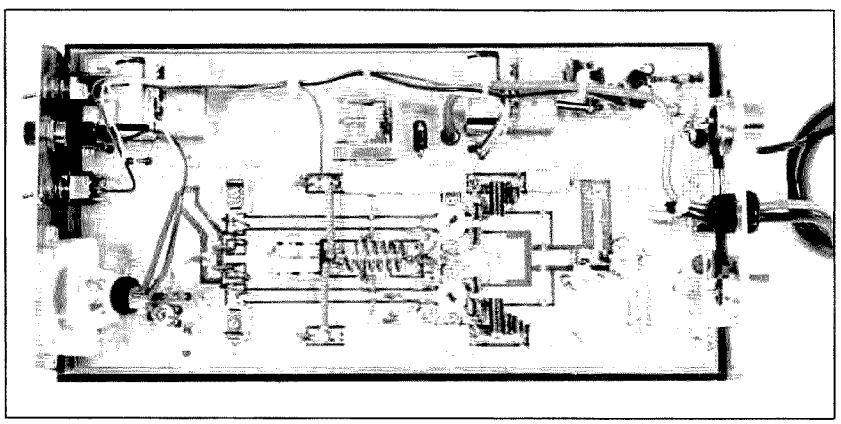
As with most power amplifiers, there really isn't too much stuff in the box. The heart of the unit is a pair of Mitsubishi 2SC2694 transistors, each rated at 75 Watts. T-R switching is handled by a pair of low-loss coaxial relays, accounting for the low 0.6-dB insertion loss in receive. There is a third relay used to switch power on and off to the power transistors and to the "on air" light. In this way, current consumption during receive is held to about 50 mA, primarily because of the meter lamp. In the SSB/CW mode, the amp stays "on" for a short time after carrier sensing drops out due to the nature of SSB and CW transmissions.

Construction

As in many of the Dick Smith kits, the manual is a reprint of an *Electronics Australia* article. This one was run in March, 1986. Be prepared to read it several times and to translate it from Australian to "American." It is, however, unfair to compare the Dick Smith kits with the ones from our old friends at Benton Harbor. If you consider the Dick Smith offerings as "projects" instead of kits, the level of documentation becomes more tolerable. It is assumed that the builder has some knowledge of rf circuitry and construction practices.

The lay ham should have no trouble with this kit/project, however, as the manual/article contains all the necessary information if you're willing to dig. For instance, page 4 of the manual/article directs you to cut the supplied brass shim stock into specified strips and fit it to the PC board "as shown in Fig. 2." I'm sorry, but if you've never built a power amp before, it doesn't make any sense. But if you refer to Fig. 9 on page 7, the fitting of this shim stock becomes clear—it ties the top and bottom ground plane of the PC board together right at the rf transistors.

This hurdle passed, the remaining construction is pretty garden variety. Be sure to refer to Fig. 5 for proper orientation of the variable caps, as the adjustment screws will have high rf voltage if they are installed backwards. You'll have to wind a few coils—no sweat, make them just as they appear in Fig. 7 and you won't go wrong. Remember, the dimensions are in millimeters! Instead of gluing the meter to the front panel, you could fashion "brackets" made of stiff wire soldered to the inside of the front panel. Fortunately, there are lots of good photographs to assist the builder in case of confusion.



Alignment

If you don't have the specified equipment, beg, borrow, or steal it! You run a real risk of blowing up the rf devices if you try to "wing it." The preferred test setup would be a vswr bridge between the radio and amp and a wattmeter on the amp output terminated in a proper load. An antenna is not a proper load! Assuming the unit was constructed properly, follow the instructions and you should be on the air in 15 minutes or less.

Summary

There is enough room in the case for a receive preamp, but with a measured 0.6-dB insertion loss, I felt that I didn't need it. The heat sink gets warm during prolonged operation, but the power output automatically shuts back as the temperature goes up as a protection measure. Make sure that your load is properly matched, as high vswr will only make the amp run hotter and shorten the life of your rf transistors. If you run the amp mobile, be sure to use heavy cable—the current draw is substantial.

For about a buck and a half a Watt, it's a lot of amp for the money. Besides, if it ever goes out, you'll be able to fix it yourself! ■

A look inside the DSE 100-Watt VHF amplifier.

Heath IP-2760 Battery Eliminator

Heath Company Dept. 011-442 Benton Harbor MI 49022 Price class: $180

Number 13 on your Feedback card

by Perry Donham KW1O

One accessory that you'll find in every ham's shack is a power supply. Some are fancy with cases to match a particular transceiver, others are general-purpose units in military-looking boxes, and there's always the home-brewed job with the 40-pound surplus transformer.

I needed a reliable 12-volt supply that could handle 10–15 Amps, and decided to try Heath's IP-2760 Battery Eliminator. The IP-2760 will run at 12 Amps forever and can deliver up to 20 Amps on peaks—perfect for my HF station.

The Circuit

As power supplies go, the IP-2760 is pretty simple. A full-wave bridge rectifier is followed by 20,000 microfarads of capacitance; voltage is then passed to an LM-317 monolithic regulator. Four hefty pass transistors provide the current-handling capability. The LM-317 is an adjustable regulator and is set up in this circuit to deliver 8–15 volts with less than a 2% drop in voltage when a load is applied. Output ripple is held to under 1%.

Two front-panel meters are provided to monitor output voltage and current. In addition to the on/off switch, a standby/operate toggle is included—handy if you want to use the supply for testing. Two color-coded banana jacks connect the unit to the rest of the world. The case is Heathkit blue with a white face, and two handles on the top make this a "portable" power supply (it weighs about 20 pounds).

Construction

It took about five hours to put the IP-2760 together. Most of the time was spent stripping wire and building the .09-Ohm, 20-Watt resistors for the pass transistors (four sets of four .33-Ohm, 5-Watt ceramic resistors wired together on two long terminal strips). As usual, there was plenty of material supplied in the kit, with quite a bit of wire left over.

"I ended up glad for the minute detail when it came time to really start hooking things up."

The remainder of the five hours was spent trying to get the little plastic strain relief for the power cord to fit into an even littler hole on the back panel. Now, I've seen these things go right in with no sweat, but it was always somebody else doing the work. I have *never* been able to get the buggers in without completely destroying them. And the manual just mocks me: "Place the line cord in the slot. Squeeze the two segments together. Insert the rear half into the hole." *As if it were that simple!*

Everything else went smoothly, although be very careful when you handle the finned heat sinks which attach to the sides of the chassis. They are *very* sharp. All of the transistors are socketed, and a generous amount of thermal compound is included. I was a bit concerned about the plastic covers used on the transistors, but they seem not to be harmed when the supply is running full out.

During construction, I kept wondering whether or not I could go faster if I just ignored the step-by-step instructions. Especially with a project this simple, all of the "Connect one end of the 12" black wire to Q6 lug C" instructions tend to get tedious. I stuck with it, though, and ended up glad for the minute detail when it came time to really start hooking things up. Wires that had been cut to a specific length were (of course) just the right size to reach to tab C, and everything fit perfectly.

I did, however, end up ignoring the instructions regarding bending wires. In many cases a wire is to be bent to a particular shape to make it from one connection to the next; I found that I couldn't manage to pre-bend the wire and have it fit. It was no big deal, I just bent one end and then measured the distance by holding it up to the circuit.

I also was a bit put off by instructions that had you solder a wire into place on one end and then remove an additional amount of insulation from the other end. This places unnecessary stress on the solder joint, so I simply stripped the wire before it was soldered.

Summary

I've built several Heath kits in my years as a ham, starting with an HW-16. They always work. The IP-2760 started right up, and the measured voltage matched the published specifications. It costs a bit more than most power supplies in its category, but I think that the pleasure of putting it together and the ability to repair it yourself are well worth the additional cost. I think that you'll find the IP-2760 a useful addition to the shack, whether you use it as a dedicated power supply or a test-bench voltage source. ■

NEW!

The AZIMUTH World Time Dual-Zone 24 Hour Station/ Travel/Alarm Clock

SPECIAL INTRODUCTORY OFFER! SAVES YOU $10.00 JUST $19.95 Plus P&H

REGULAR $29.95 RETAIL VALUE

SEE DUAL-ZONES! FINDS "GREY LINE" WORLDWIDE—TOO!
Displays LOCAL plus 24 Cities/Zones around the world. Set to LONDON for GMT/Universal for easy QSO logging. Both displays show 24-Hour Zulu. Compensates for Intl. Date Line world-wide + or — from local date. Special Summer/Daylight Savings Time switch memorizes changes Zone by Zone.

LEGENDARY QUARTZ ACCURACY—ALARM & STANDARD BATTERIES
Ingenious new quartz digital design runs on one oscillator. Long life AAA batteries included. Excellent accuracy important in ham radio. Compact size (2" x 4.5" x 5"). Great for your station, DXpeditions or travel.

Sharp, easy to read digits. Set alarm for schedules. Folding easel stand. Black leather-like travel pouch.

A Power Supply Primer: Part I

Without a well-regulated and reliable power supply, your state-of-the-art rig will work just about as well as a megaphone.

Number 1 on your Feedback card

No matter how you cut it, the dc power supply is of critical importance to the success of any construction project. It's easy to understand how a project needs correct dc power to operate—about that there is little argument. But what about reliability? The dc power supply is unfortunately the last thing thought of by both amateurs and professional designers. Let me make a few points in that regard.

Point One. During a time when I worked repairing medical equipment at a major hospital, records were kept regarding all repairs. It was found that (over a six-month period) 36 percent of all failures were in the dc power supply either as primary or secondary failures. No other single kind of failure even approached the power-supply failure rate.

Point Two. Several well-known amateur radio transceivers suffered excessive downtime due to underspeced power-supply rectifiers. Once the amateurs involved followed the derating advice that will be given in this series, the reliability problem went away (except on Field Day, when all bets are off!).

Point Three. While working for the Food and Drug Administration, I had to examine reports of excessive failure in a certain medical device (fortunately not a piece of life-saving equipment). More than half of the failures reported for that equipment were either rectifiers, filter capacitors, or voltage regulators in the dc power supply—the designer overlooked some elementary design rules which even a novice could appreciate and follow!

Point Four. The US Naval Material Command, recognizing that low-voltage dc power supplies in Navy equipment are a major source of reliability problems, issued tough new guidelines for the design of supplies in military electronic equipment.

Clearly, the design of dc power supplies is a nontrivial matter when considered from a suitability and reliability point of view. In this article and those to follow, we will discuss the proper design of small dc power supplies for amateur and hobbyist applications. In order to keep the arithmetic to a minimum, we will use "rules of thumb" which are proven effective in some cases. We will also provide several Basic computer programs to assist in working some of the arithmetic.

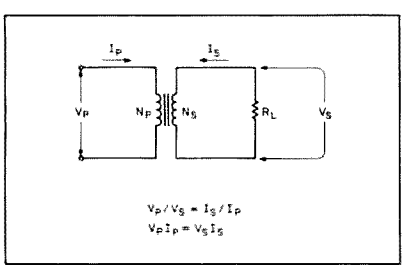

Fig. 1. The transformer is essentially a voltage converter.

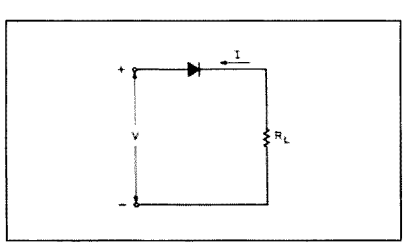

Fig. 2(a). Forward-biased half-wave rectifier.

Basic Elements of the Dc Power Supply

The basic dc power supply consists of the following elements: *transformer, rectifier, filter,* and sometimes *voltage regulator.* Also included in some dc supplies are the following features: *overvoltage protection, current limiting, fusing, transient protection,* and various *status indicators.* In the sections to follow, we will discuss each of these.

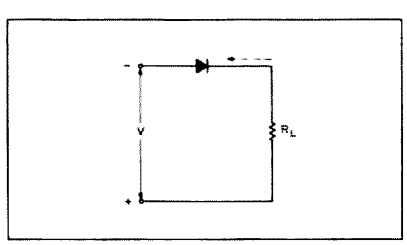

Fig. 2(b). Reverse-biased half-wave rectifier.

Transformers

The transformer (Fig. 1) is essentially a voltage converter. It changes the standard line voltage (115 V ac in the U.S.) to a higher or lower voltage required for the operation of electronic circuits. In some other cases, the transformer will be used for *isolation* and will deliver the same output voltage as is applied to the input. The main use of these transformers is *safety.* Many electronic appliances (especially but not universally those marked "ac/dc") are unsafe when operated either out of doors or in a "grounded environment" indoors (e.g., in the cellar on a concrete floor).

Most of the transformers which we will consider are *step-down* types because solid-state electronic circuits typically operate from lower voltages. The "typical" range for most projects is 1.5 V dc to 30 V dc: Linear ICs tend to require ±4.5 V dc to ±18 V dc; CMOS digital circuits use ±4 V dc to ±15 V dc; TTL digital circuits require 0 and +5 V dc (regulated); transistor circuits require the entire range given above. Some integrated circuits fall outside of the ranges above, but the limits are proper for most devices.

Because the transformer is very efficient, stepping the potential down in the secondary winding increases the current available for

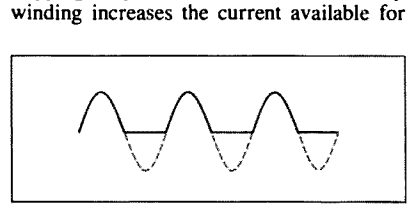

Fig. 2(c). Output waveform of a half-wave rectifier.

any given voltage level (the opposite is true for step-up transformers). The primary volt-Ampere (VA) rating (volts x Amperes) is very nearly equal to the VA rating of the secondary. Simply stated: $V_{pri} \times I_{pri} = V_{sec} \times I_{sec}$, where: V_{pri} is the voltage applied to the primary winding, V_{sec} is the voltage appearing across the secondary winding, I_{pri} is the current flowing in the primary winding, and I_{sec} is the load current drawn from the secondary winding.

In most transformers, the primary winding is closest to the core and so is not able to dissipate heat to the air as well as the secondary winding. As a result, the limiting factor for the transformer is the *primary VA rating*. This rating should not be exceeded, or low reliability will result. As a matter of normal procedure, I prefer to specify the primary VA rating at not less then 120 percent of the expected power requirement for applications that are analogous to the "intermittent commercial and amateur service" (ICAS) ratings given for vacuum tubes (Watts = volts x Amps).

Where service is continuous or where the environment is hostile (which usually means heat dissipation is limited), then I prefer to specify a VA rating that is 200 percent of the power requirements. In other words, if a project will draw 3 Amperes at 6.3 volts (P = 3 x 6.3 = 18.9 Watts), then I would look for a VA rating of 23 for ICAS-type service or 38 for critical service. These figures translate into secondary current ratings of greater than 3.7 Amperes and greater than 6 Amperes, respectively.

In general, for ICAS-type service, military transformers can be operated at secondary currents greater than the marked values because they are normally derated considerably. I would not recommend pushing these ratings for critical service, however.

Rectifiers

The rectifier converts the alternating current from the secondary winding of the transformer into pulsating dc. The output of the rectifier is not the "pure" dc which we would obtain from batteries, but it is at least unidirectional and can be "filtered pure" (well, almost pure). The simplest form of rectifier is the half-wave rectifier.

All rectifiers operate on the same principle, whether they are vacuum tube, mercury vapor tube, cold cathode gas tube, or solid-state PN junction diodes (or even "mechanical rectifiers," which the old-timers will remember): They produce unidirectional current from bi-directional ac current by virtue of *conducting current in only one direction.* When an ac sine wave is applied to the input of this circuit, current passes through the rectifier only when its anode is more positive than its cathode, as in Fig. 2(a). On the other half of the ac cycle, Fig. 2(b), the rectifier is reverse-biased and so will not conduct electrical current through load R_L.

The waveform associated with the half-wave rectifier is shown in Fig. 2(c). This waveform appears across load resistor R_L. Note that the waveform exists only when the

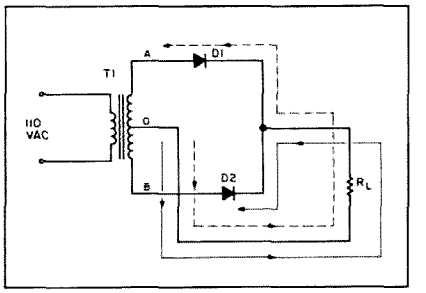

Fig. 3(a). Basic full-wave rectifier using a center-tapped transformer.

input waveform is positive; the negative half-cycle is lost. Since half of the cycle is not used, the half-wave rectifier is wasteful of energy.

The half-wave rectifier has an average output potential that is approximately 45 percent of the applied rms potential, and its "ripple" amounts to 120 percent. To add to the problems of this design, the transformer used must have a primary VA rating that is 40 percent higher than is required if the entire cycle were used (as in full-wave rectification).

A basic full-wave rectifier using a center-tapped transformer is shown in Fig. 3(a). At any given ac peak voltage, one end of the transformer secondary is positive while the other end is negative. The center-tap is at a potential that is half that found across the entire secondary. Therefore, if the center-tap is used as the common reference voltage, then equal and opposite polarity potentials are found at either end of the secondary with respect to the center-tap.

Let's consider the case when the top of the secondary is more positive than the bottom. Current flows from the common center-tap through load resistor R_L and forward-biased diode D1 (whose anode is more positive than the cathode) and then back to the transformer secondary winding. During this period, diode D2 is reverse-biased due to the negative potential on its anode, so no current flows in D2.

On the alternate half-cycle, diode D1 becomes reverse-biased and D2 is forward-biased. Current then flows from the center-tap

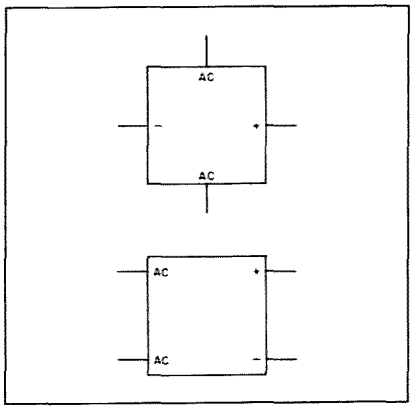

Fig. 5. Circuit symbols for integrated bridge-rectifier assemblies.

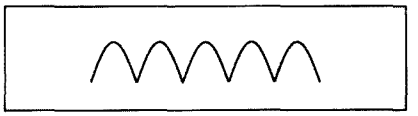

Fig. 3(b). Characteristic double-humped waveform of full-wave rectifier.

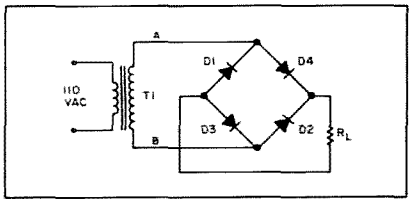

Fig. 4. The bridge rectifier requires no center tap on the transformer.

through R_L and diode D2 back to the transformer secondary.

Note that in both cases the current flows in the *same direction* through load resistance R_L. This action produces the characteristic "double-humped" waveform across R_L shown in Fig. 3(b). We can say the negative half of the ac cycle is "folded up" to the positive side of baseline by the switching action of the diodes.

Another form of full-wave rectifier is the "bridge-rectifier" circuit shown in Fig. 4. It employs a diode "ring" (D1 through D4) for rectification. The secondary of the transformer is not center-tapped because the diode ring provides the negative (and sometimes grounded) zero reference point. The two "corners" of the bridge circuit labelled "−" and "+" go to the positive and negative dc outputs of the power supply or to the same polarity points on the filter capacitor.

Although some designs use individual rectifiers for D1-D4, the trend today is to use a bridge "stack" that includes all four diodes in one package. Fig. 5 shows two common circuit symbols for these devices.

Since the bridge rectifier employs the en-

1987 CALLBOOKS

The "Flying Horse" sets the standards

Continuing a 66 year tradition, there are three new Callbooks for 1987.

The North American Callbook lists the calls, names, and address information for licensed amateurs in all countries from Canada to Panama including Greenland, Bermuda, and the Caribbean islands plus Hawaii and the U.S. possessions.

The International Callbook lists the amateurs in countries outside North America. Coverage includes South America, Europe, Africa, Asia, and the Pacific area.

The 1987 Callbook Supplement is a new idea in Callbook updates; it lists the activity in both the North American and International Callbooks. Published June 1, 1987, this Supplement will include all the new licenses, address changes, and call sign changes for the preceding 6 months.

Publication date for the 1987 Callbooks is December 1, 1986. See your dealer or order now directly from the publisher.

tire secondary voltage, it produces a pulsating dc output potential that is *twice* that of the regular full-wave rectifier that needs a center-tap, assuming the same transformer (of course). There is one little catch, however. The bridge rectifier can safely deliver only half of the output current from that transformer! This requirement is based on the fact that the primary VA rating still must not be exceeded.

If the transformer employs a center-tapped secondary winding then it is an almost sure bet that the manufacturer rated the device for regular full-wave—not bridge—service. We can use that transformer for bridge service, but we should accordingly derate the output current by one-half. If the transformer is not center-tapped, then it was probably designed for bridge-rectifier service and can be used at the full rated current.

The average dc potential across an unfiltered full-wave rectified power supply (bridge or otherwise) is approximately 90 percent of the applied rms potential. Full-wave supplies produce 48 percent ripple, which is a lot less than half-wave circuits but still requires filtering. Since both halves of the ac cycle are used, the ripple frequency of a full-wave supply is twice the line frequency, or 120 Hz for a 60-Hz power line; half-wave ripple frequency is the same as the power-line frequency.

Rectifier Specifications

Solid-state rectifiers are generally reliable devices. Premature failure of rectifiers is usually due to improper specification by the design engineer. There are two principal rectifier specifications of concern to us: *peak inverse voltage*, or piv (also called *peak reverse voltage*), and *forward current*.

Peak Inverse Voltage

The peak inverse voltage is maximum reverse-bias potential that the rectifier can sustain without damage. It is this specification that seems to give the most trouble. The problem is that many designers fail to recognize the actual reverse voltage in a circuit that contains a reactive element like a filter capacitor. Most filters use a capacitor across the output of the rectifier, as in Fig. 6(a). This filter charges to the peak voltage across the secondary, V_p. On the alternate half-cycle of the ac, the diode is reverse-biased and the capacitor charge is effectively in series with the secondary voltage. This is shown in the redrawn version of the circuit, shown in Fig. 6(b). Thus the actual reverse voltage is *twice* what one might suspect intuitively.

Since V_p is 1.414 times the applied rms voltage, the peak reverse voltage seen by the rectifier is 2 x 1.414 x V_{rms}, or 2.83 V_{rms}. The piv rating of the rectifier must be at least 2.83 times the applied rms voltage, and three to four times would allow a safety margin for voltage rating tolerances.

The piv rating error was the one made by a manufacturer of amateur transceivers. The HV rectifier diodes were rated at 1000 volts piv, and the applied voltage was 450 V_{rms}. Thus, because of the filter capacitors, almost 1300 volts were applied to those diodes in the reverse direction, and the result was new diodes and blown fuses every few months!

As a general rule, it is wise to use 1000-volt-piv diodes for all applications up to 300 volts rms, including low-voltage power supplies. In the 1-Ampere size, the 1N4007 is a good choice.

Forward Current

The forward current rating of the rectifier is the maximum sustained current that the device will pass in the forward-biased direction. Do not confuse this rating with the surge current rating, which is much higher. There might be a 25X factor between the two ratings. In other words, a 1-Ampere diode might have a surge current rating of 25 Amperes or more. This rating is the current that is tolerated by the diode for one cycle of the ac input waveform, or less than 17 milliseconds at 60 Hz!

In some cases, there has been a little, er, uh, creative spec writing on the part of *some* rectifier vendors. Since amateurs and hobbyists can often use ICAS-type ratings, they tend to rate the diode at twice the real forward current rating—especially in the over-1-Ampere category of devices. Thus, I can recall seeing a diode marked with a type number that Motorola claimed was rated at 1.5 Amperes being hawked in a local dealer as a 3-Ampere device! Since Motorola made the thing, I tend to trust their label over that of a surplus rebrander.

In the case of bulk-packed "bargain" rectifiers, the forward current rating is an out and out lie—not merely an almost-reasonable stretching of the truth. The lack of a type number or recognizable semiconductor manufacturer's logo generally betrays these devices. If the rectifier is of uncertain parentage, then be suspicious and derate them by 50 percent or more (in other words, consider a "1-Ampere" device to be a 500-mA rectifier). Since I prefer to specify rectifier forward current at twice (or more) the expected normal maximum load current, these devices should be rated by you at one-fourth the load current.

When you actually mount either a replacement (in case of repair) or an original rectifier, be sure to give the device plenty of breathing room—it gets quite hot. Axial lead rectifiers should be mounted 1/4" from the surface of the printed circuit board, while stud-mounted rectifiers should be mounted on heat sinks. Bridge stacks intended for PC-board mounting should also be mounted with breathing space between them and the board. When laying out a new project, do not mount the rectifier in close proximity to heat-sensitive circuits such as oscillators, amplifiers, and so forth. If an already-built circuit seems unstable with respect to temperature and the rectifier is mounted close to sensitive components, suspect the rectifier as the problem.

Looking Ahead

In the next installment of this series, we will discuss filter circuits for simple low-voltage power supplies. ■

Born-Again Bargain Boards

It's magic! Turn scrap PC boards into an electronic library of pre-etched building blocks.

Number 2 on your Feedback card

I was visiting my friend Bob in his basement ham shack one evening, and I was enjoying myself watching him rummage around in his junk pile as he tried yet again to shrink it to a manageable size.

"Hey, what are those?" I asked as he retrieved a dusty box from beneath a workbench and hauled it toward the basement bulkhead on his way to the trash can.

"It's a lifetime supply of PC boards," Bob said, "all unused, no components, just etched boards."

"Gee, it seems a shame to just throw them away," I said. "There must be something they could be used for."

"What, square Frisbees? Shingles for a leaky doghouse? What earthly good is a PC board somebody else has etched?" Bob laughed. "They've kicked around under my bench for years, and I never did anything with them. Here, you want them? Take them away!"

That's how I wound up with 20 pounds of assorted "pre-etched" circuit boards, a term akin to "pre-owned automobile." Somewhere, some hapless company had made a mistake and ordered too many PC boards for its needs, or perhaps a PC board designer made a few layout errors. It's also possible that the artwork for the board was revised and the old-generation boards were junked, or that the boards were rejected by quality assurance.

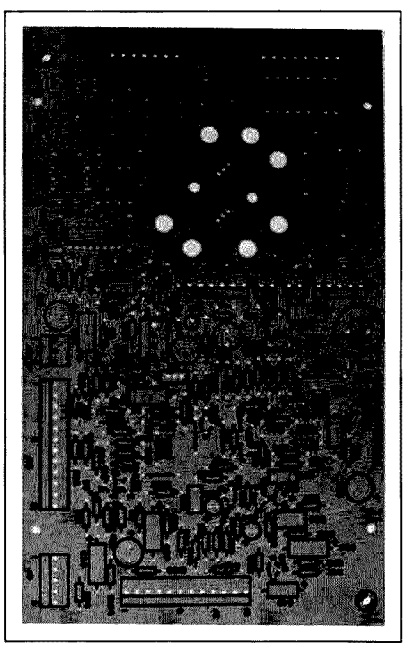

Photo A. Component side of the "Tuner Interface" analog PC board. The power supply section is in the upper right portion of the board.

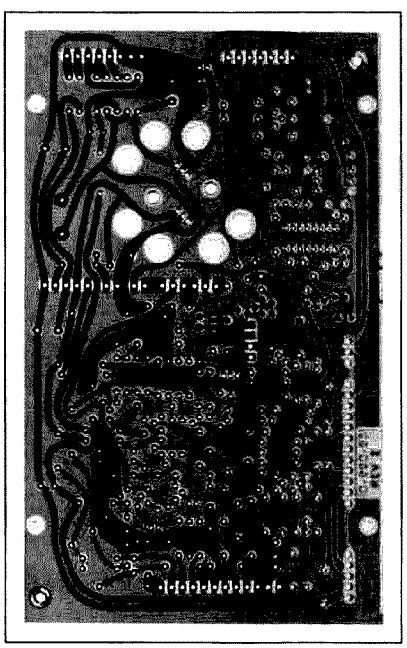

Photo B. Foil side of the "Tuner Interface" analog PC board. The power supply section is in the upper left portion of the board.

Sorting Through the Boards

In any case, what kind of silk purses could be made from this collection of electronic sow's ears? I began by sorting through the boards: Bob had assembled a fine assortment of PC boards, that was for sure.

I divided the boards into two general classes: digital and analog. The digital boards were characterized by large numbers of integrated-circuit DIP pad patterns arranged in neat rows. The analog boards had a few DIP patterns, but most of the pads were laid out in an irregular fashion.

Most of the digital boards were two-sided, with traces on both sides; a few boards were of multilayer construction. When I held these to the light, I could see a dark inner layer which didn't correspond to the traces on either surface of the board. Many of the analog boards were of single-sided construction.

Almost all of the boards were made from the familiar green-colored epoxy-fiberglass material that is widely used in industrial and military electronics. A few of the analog boards were made from a tan-colored epoxy-paper laminate. There were even one or two boards made from brown paper-phenolic material; this stuff was used in huge quantities for consumer goods. Its most notable features are a barnlike smell when it's overheated and its tendency to lose traces when a soldering iron is applied for too long. I threw these boards away.

The Digital Boards

I selected a double-sided digital board for my first experiments. The board was approximately six inches by nine inches and it had pads for approximately 30 integrated circuits, all of 14- and 16-pin sizes. There was a nice gold-plated edge connector on one end and pads for test points at the other.

While traces snaked every which way between IC locations, there was a power bus pattern that ran to the corner pads of most of the IC locations. If I could remove all of the traces except the bus, perhaps I could use the card as a breadboard.

I plugged in the soldering iron and, while it was warming up, I fitted a new, sharp blade into an X-acto® knife. I selected a PC trace at random and cut through the copper close to the IC pad at each end. I held the hot soldering iron onto one cut end of the trace and simultaneously pried up the trace's end with the knife.

Next, I grabbed the raised end of the trace with a pair of needle-nose pliers and pulled. Zzzip! The trace peeled cleanly away from the board and left a ghosty trail on the board to mark its passing.

I fell into a steady rhythm: Cut both ends, heat and slightly lift one end of the trace, and then peel away the traces when a bunch were ready. There were a couple of hazards: It was essential to use a sharp blade in the X-acto knife, and the exposed edges of the peeled-away copper traces were razor-sharp and capable of dealing exquisite "paper" cuts.

When all the signal traces were stripped away, I installed wire-wrap IC sockets and soldered their pins to the power bus pads and two corner pads for mechanical strength. Locations for bypass capacitors were already pre-etched next to each IC, and the junk box yielded a matching edge connector. The board was ready to be wrapped.

Was the time required to strip away the traces well spent? Yes, I think so. Thanks to its power buses and good ground plane, the board would be electrically less noisy than a totally wire-wrapped equivalent, and its cost was much less than a commercially available bus board.

The technique works best for small, double-sided PC boards that are laid out in an open fashion. Multilayer boards are unsalvageable if signal traces are buried in the inner layers; if the inner layers are the power and ground planes, the board may be usable. Also, avoid densely packed, large boards with more than 30 IC locations. The larger boards are harder to work with and are less useful for small projects.

The Analog Boards

Next, I turned my attention to the pile of analog boards from Bob's junk box. At first glance, these boards seemed less useful than the digital boards. There was no regular power-distribution bus, nor were there many DIP locations. There were dozens of identical boards, however.

One board caught my eye: It was a single-sided board that measured about five by eight inches. Its top surface was silk-screened with component outlines and the words "Tuner Interface" (Photo A). The pattern of copper paths on the reverse side (Photo B) was simple enough to trace into a schematic, but why bother?

After staring at the board for a few minutes, however, I noticed an interesting pattern: The outlines of electrolytic capacitors marked with polarity symbols, diodes, and a heat sink were visible in the silk-screened markings. Whatever the board's ultimate function was, it included a power supply section with IC voltage regulators.

Power supplies are basic building blocks common to almost every project, and it's time-consuming to lash one together from scratch. The circuitry doesn't vary much from design to design: There's always a rectifier and a filter capacitor, and often a three-lead voltage-regulator IC of the 78XX family.

The chances were good that the designer of the board used the same building blocks in his power supply. I spent a few minutes tracing etch and discovered that he had. I could install my own components, ignore or cut away the unwanted circuitry on the board, and have a regulated power supply building block for future projects. There were two dozen boards in the pile, so I had a lifetime supply.

Tracing the power supply wasn't hard, so I turned my attention to the rest of the board. Could I figure out what it was used for and perhaps determine what components were used? The low density of components and single-sided construction suggested that the board had been built for use in a consumer product, perhaps a projection television receiver.

I selected a DIP IC location on the board as a starting point and systematically examined all traces going to its pins. Two traces made their way back into the power-supply section, and by examining the polarity markings on the silk-screened capacitor outlines, I was able to determine which IC pin received positive voltage and which was grounded.

With that information, I began a search for a linear IC whose pins matched my findings. I selected a data book and reviewed common operational amplifiers and comparators: no dice. Next, I looked through the consumer IC section of the data book: again, no luck. I switched to another vendor's data book and repeated the process: bingo! There, on page 792 of the RCA linear IC data book was the CA3159E, a "horizontal processor and agc detector" device.

The data book included a functional block diagram of the IC and an application circuit, so I was able to identify the input and output pins that were being used. A little more tracing of PC patterns and I discovered that only the agc portion of the chip was being used. With a little effort, the circuit could be adapted to other functions. I had added another potential pre-etched "building block" to my collection.

Helpful Hints

I found a couple of techniques very helpful to the process of tracing PC patterns. When an etched run has been followed to its ends, it's a good idea to mark the run to avoid confusion. I found that a Pilot ultra-fine point permanent marker, type SC-UF, worked well and semi-permanently marked both copper traces and fiberglass. The marker's fine, sharp point also made it possible to write part numbers on the circuit side of the board. Alcohol or solder-flux solvent will remove the ink.

It's also helpful to mark the beginning and end of a trace and then flip the PC board over to see what components are in the vicinity. I took a pair of plastic-headed map pins and blunted their points. It was easy to poke the pins through the trace's beginning and ending holes and then reverse the board.

Once you have identified the function of a PC board or a portion thereof, you can choose to attack the board with a nibbling tool or a bandsaw and cut out the interesting part. Avoid breathing the dust from a glass-epoxy board because it's an irritant and a good substitute for itching powder. Make sure that you haven't introduced any short circuits due to copper burrs when you made the cuts.

Choosing the Boards

If you should find a batch of boards for sale at a flea market, look them over carefully before you decide to buy them. Make sure that the boards have been fully processed. Avoid those that have bare copper traces or chemical residue stains. Some boards have had their gold-plated contact fingers clipped away. These boards may still be useful if an IC location is used as a connector site.

The most desirable boards will have their function and component part numbers silk-screened on the component side of the board. Unlabeled boards, "mystery" boards, and large digital boards are less useful. Do not spend much money on any bare board. Remember, you're buying someone else's mistake and you still have some detective work ahead.

Is it worthwhile to salvage unused PC boards? In general, yes, if you can identify a basic building-block function that you can use. The more boards of a useful type you have, the better, because your research time has a larger payoff.

Don't overlook the educational benefits of pitting your reverse-engineering skills against an unknown designer's efforts. The secret is to take advantage of what would otherwise go to waste and make it useful to you. ■

FIVE BUCKS FOR FIVE BOARDS

A package of five circuit boards is available from the author for $5 ppd. The boards are of mixed sizes and shapes and are representative of the types discussed in this article. Send a check or money order to: Brad Thompson, 77 Waltham Street, Maynard MA 01754.

Defuse RFI

A couple of caps and some coax put an end to crisped lips and cruddy audio.

Number 3 on your Feedback card

The response to "Lightning Never Strikes" in the August, 1986, issue was so great that we decided to reprint this W0WUZ classic from 1983.—Eds.

As a long-time denizen of 10 meters, I have learned along with my like-minded compatriots to suffer when the band is really running well and our friends from 80, 40, and 20 come up to partake of the fun and games. Suffer? You bet!

A ground wire is totally ineffective over 1/8 wavelengths on the frequency in use. Dc yes; rf no. This works out to about 4 feet on ten. I realize it is extremely difficult to achieve a situation where your ground wire is 4 feet or less, *to the earth*, not the toilet!

Another problem (coincidental with the above) is rf feedback in the TX audio, which in its least annoying form makes your voice sound like vibrating chicken wire and in its worst sends spurs running 100 kHz up and down from your central frequency (or from dc to daylight, as we used to say in Navy ECM).

For considerably less than $5, there are steps to take that can result in hearing, either while in QSO or afterwards when the station you worked is talking with someone else, "Lord, the guy in _____ had beautiful audio!" These measures are not new, but like so many other pieces of hands-on know-how, they need to be repeated and correlated every now and then to refresh and instruct those who don't read electronics books on the john.

If your rig is in the basement, effect a 1/2" 45° hole in the wall with a masonry bit or star drill and drive a 6-to-8-foot ground rod, leaving about 5 inches protruding. Seal with waterproof putty or silicone. Properly placed, this will give you about a 1-foot ground connection. For those not in the basement, a coaxial ground is needed.[1] This is a simple miracle that makes your effective ground length only a few inches!

"There is absolutely no excuse for the cruddy signals on HF. . . if you're not going for the solution, you're part of the problem."

A coax ground is made using *good* quality (95% shield braid) coax such as Columbia 1107 or 1108 RG-8/X or Mini-8 with a stranded center conductor. The center conductor is used as the ground wire, connected to the *rf generating unit* and the outside ground system. It's bypassed at each end with a .01-uF, 1-kV disc capacitor to the shield braid (see Fig. 1). Don't tie all of your station's components together with zip cord or aluminum wire. Let the coax shield handle the dc grounding between units as it is seldom over a foot or so long. Otherwise, you set up ground rf loops that defeat everything you've done.

Microphones seem to be universally designed for use in high school auditoriums, with no rf suppression whatsoever. This is simple, so simple that there is absolutely no excuse for rf feedback in this area. All that is usually necessary is to install a .01-uF disc capacitor across the microphone cartridge (do it quickly because it can't take much heat!) and add a 1-mH choke in series with the audio high lead. This may be done at the mike or on the inside of the mike jack of the transmitter, which is more convenient when using several microphones. If using a power mike, ferrite beads on the transistor base leads and a pi filter using two .005-uF capacitors with a 1-mH choke are called for (Fig. 2).

In summation, there is absolutely no excuse for the cruddy signals on HF, and if you're not going for the solution, you're certainly part of the problem. These steps will also knock an RFI problem in the ditch. ■

Commodore's RTTY Riot

If you can get the C-64 away from the kids, try this simple method of computerizing your TTY operation.

Number 4 on your Feedback card

The Baudot Model 14, 15, and 19 Teletype® machines have to some extent fallen from favor. Even the wondrous Model 33 (ASCII) is now selling at dumping prices at flea markets. It's no secret that flea-market prices tend to be a bellwether of change. In this case, they simply reflect the impact of personal computers on the ham shack. But the rush to get rid of the old reliable printer workhorses may be a bit premature: They continue to be great hard-copy machines for RTTY, and interfacing to the C-64 through the current loop can be done for just a few dollars and very little effort.

This home-brew C-64 interface/KG3V-software combination will go receive or transmit at 45 bps or 110 bps with the Hal ST-6—and probably with any terminal unit that is presently connected (or connectable) to the 60-mA loop of a Teletype® machine such as a Model 14, 15, or 19. (300 bps and 1,200 bps with home-brew KG3V modem—see July, 1981, *Ham Radio*.)

There are a number of ways to work out a practical hookup between the older RTTY tuning units, printers, and the PCs most often found in ham shacks. Except for its cost effectiveness, this project doesn't break any new ground. And as for the computer part, the Commodore 64 appears to be as popular a choice as any for the ham shack. It also happens to have a user port that is a very friendly place to gain access to the operating system.

We have one Model 15 working perfectly with this interface and a ten-year-old home-brew demodulator built with polar relays and another with a Hal ST-6. With regard to the latter, as the loop current is supplied by the tuning unit, the TTY printer can be eliminated if desired. When this is done, a current-limiting device (100 mA maximum) must be installed in the loop to protect the interface. (Note: Some ST-6s may require a small modification to enable 75- to 110-baud operation. The details of this mod are available from the Hal corporation.)

Fig. 1 shows a functional block diagram of the various units required to complete the project. If an existing station is to be converted in this manner, nothing need be disturbed except for breaking the loop current line to make a series connection with the interface (two wires). The C-64 is not disturbed in any way at all. Simply plug in the interface at the user port and load the "RTTY" program.

One advantage of using this system is that when you are not in the shack, the computer can be switched off without breaking the loop. Therefore, autostart traffic can still be copied with the page printer.

The software required to turn your C-64 into a RTTY machine is the brainchild of Thomas B. Zelwanger KG3V. The program *and* documentation (at latest revision) can

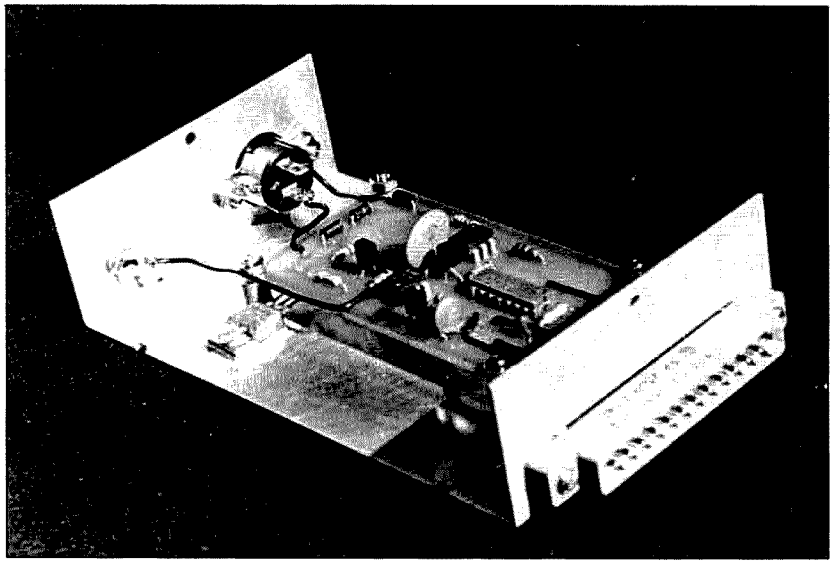

Photo A. The fully assembled interface with top cover removed.

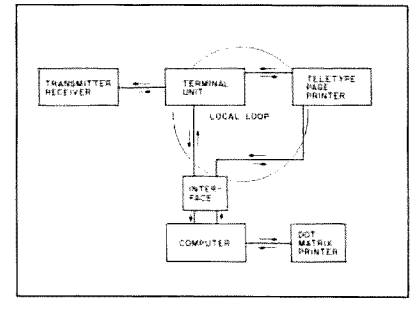

Fig. 1. Block diagram, RTTY local-loop configuration.

be obtained from KG3V (PO Box 62, State College PA 16804). Send Tom a blank tape or disk along with $2 for postage and packing. The purpose of his generosity is to encourage greater activity on RTTY, and while you won't find all the bells and whistles of commercial software on the KG3V program, it is nevertheless very effective.

Construction of the interface is quite conventional. There is lots of room on the board for the parts. Use standard printed-circuit cautions in the parts assembly. Radio Shack part numbers are given in the parts list when possible.

Fig. 2 shows the schematic diagram, Fig. 3 shows the circuit-board layout, and Fig. 4 shows the parts placement in graphic scale.

Q1 (RCA SK-3220/198) is packaged complete with mounting hardware. Substitutes for this part may be packaged individually. This transistor is mounted to the circuit board and to the case for a heat sink. To ensure a precision fit between Q1 and the circuit board and the case, use the spacer length called for and assemble the transistor as shown in Fig. 4. The case requires the drilling of nine holes and a cutout for the edge connector, as shown in Fig. 5.

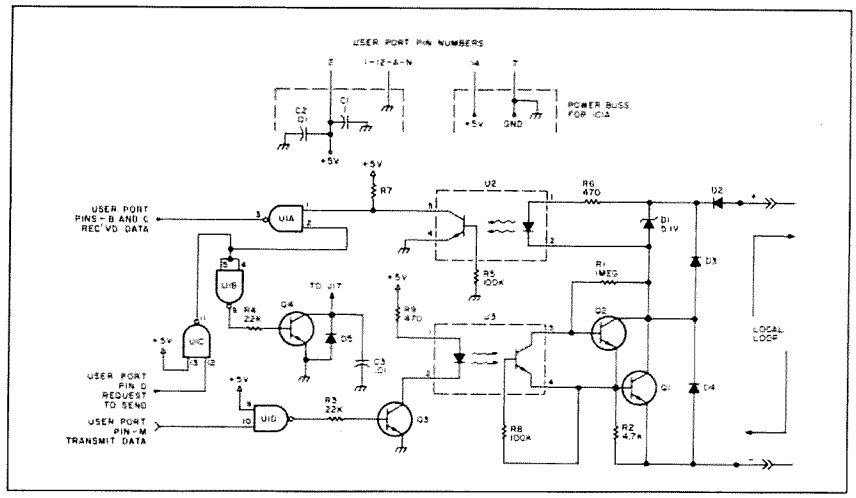

Fig. 2. RTTY/C-64 interface schematic.

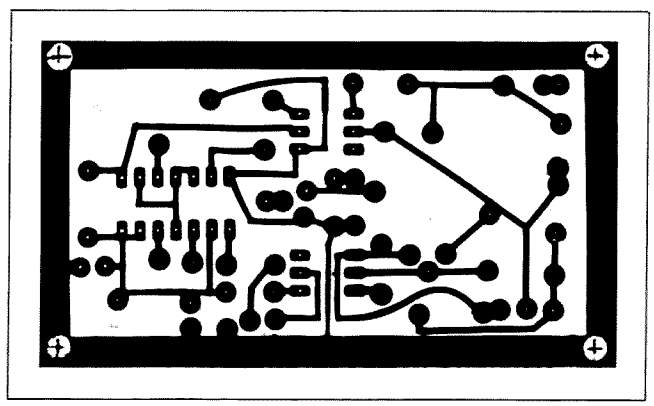

Fig. 3. Interface circuit board.

Circuit Description

As is well known to RTTY aficionados, there are few electrical circuits in use by hams as simple as the common local loop. Its only purpose is to interconnect the peripherals commonly associated with the RTTY mode. This loop, or common line, is a universal message cable for the serial data coming from or sent by these peripherals. However, all RTTY gear (pre-solid-state) incorporates high-voltage circuits and lots of rugged components. Computers are not quite that simple. The object of the project interface is to make the C-64 compatible with the local loop.

The basic function of the interface is to orchestrate the transfer of data between the high voltage levels of the ST-6 (et al) and the TTL voltage levels of the computer.

With the software driver loaded and running, the user port is configured as an RS-232C data port. Add the interface, and the receive serial-data stream enters the computer at pins B and C. On transmit, a request-to-send signal is sent by the computer to pin D, and the transmit serial-data stream leaves from pin M. The request-to-send signal can be used to control the transceiver. More on that later.

Only the pins in Table 1 are used for this project; the remainder can be disregarded.

The project interface is seen by the terminal unit as just another peripheral. Connection to the loop is made by breaking the circuit and splicing in the interface with a serial connection through PL-1. Polarity must be observed. Turn off power to the computer before plugging in the interface, and switch off the tuning unit before working on the external loop circuit.

The emitter of Q1, emulating a normally closed switch, is enabled open when the base current of driver transistor Q2 is shorted by the output transistor in optoisolator U3.

R1 supplies a small current to Q2, which provides a bias to hold Q1 closed during mark pulses. This normally closed switching default is an important feature. The normally closed Q1 switch preserves local-loop continuity and allows data flow through the terminal unit and printer, even when the computer is switched off or disconnected from the project interface.

Data generated by the computer has a logic orientation as is required for RTTY encoding. Mark is a 1 (or 5 volts). Space is a 0 (zero volts). The outbound data stream of ones and zeros is present only on transmit, appears at pin 10 of IC1, and is routed to output pin M.

U1 has four NAND gates. Section U1D is set up to invert the computer output so that mark = 0 and space = 1. The output of this gate (pin 8) drives Q3 through a current-limiting resistor (R3) at the base. Q3 conducts on space and switches on the photodiode portion of U3.

The switched-on photodiode triggers its optically coupled transistor into conduction, which results in a drop in the bias current of Q2, thus turning it off. The normally closed switch then opens. This breaks the local loop for the duration of the space pulse.

Data from the loop is received through optoisolator U2 where the photodiode and series resistor R6 shunts zener diode D1, which is connected in series with Q1. R6 limits photodiode current to 8 mA during mark, or 60-mA loop current.

In the absence of loop current, defined by the presence of space pulses, the U2's photodiode turns off and the phototransistor stops conducting.

When the photodiode switches off, pull-up resistor R7 develops a 5-volt level at pin 1 of U1. Gate U1A inverts the 5-volt level to a logic-0 voltage level. This signal appears at pins B and C on the edge connector.

D3 and D4 avert voltage-spike damage to components on the loop side of the interface. D2 protects the interface from accidentally reversed loop polarity.

The C-64 RS-232C port has full-duplex capability, but it cannot be paired with current-loop RTTY machines because the local loop is not a full-duplex circuit. A design feature of the project interface eliminates interference to received data caused by echoing.

When the control operator elects to transmit, the interface comes to attention with two responses. First, pin D on the edge connector gets a request to send in the form of a logic 1. This signal also appears on pin 12 of U1 (gate C), which inverts the signal. The output of gate C appears at pin 2 of U1 (gate A), which cuts off the output of this gate.

This latter feature prevents transmitted data from filling the C-64 receive buffer. Without it, the receive buffer will fill from the previous transmission and dump to the

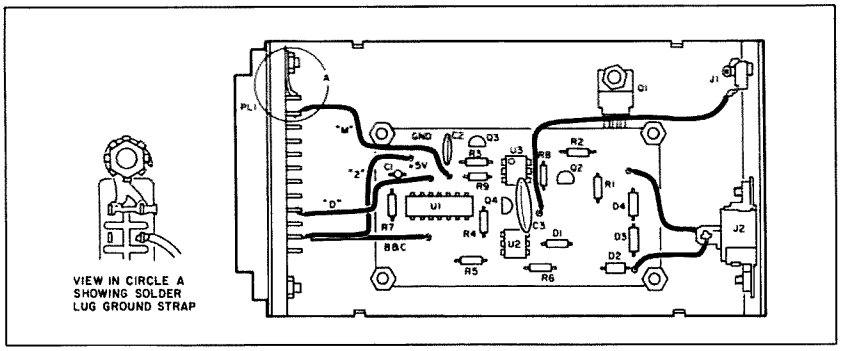

Fig. 4. Parts placement.

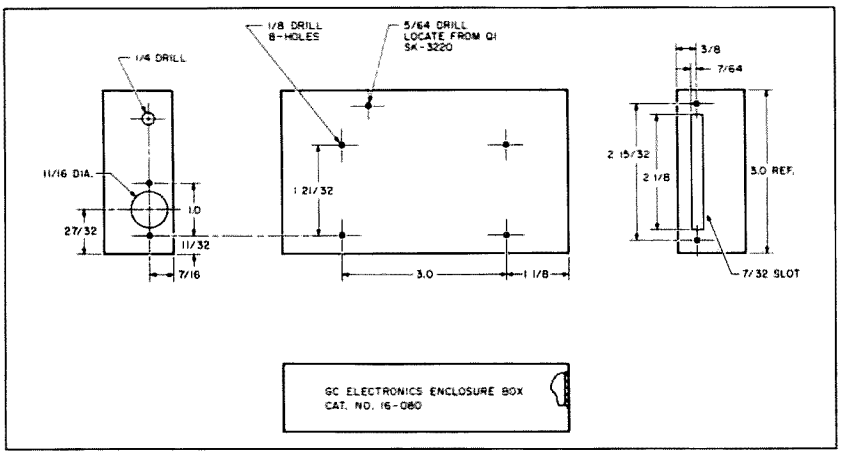

Fig. 5. Case modification.

screen before the incoming data stream can be reviewed.

An additional design feature utilizes an option available on most transceivers and transmitters for using the PTT line. With this feature, the transceiver can be controlled from the computer keyboard. This is done by transistor Q4, which is biased by U1B through current-limiting resistor R4. U1B inverts the logic 0 sent by U1C and turns on Q4. CR4 protects Q4 from the reverse EMF generated by relay coils in some radio equipment.

Q4 is heavy enough to switch on the PTT current in most rigs, but a PTT line with an open voltage greater than 20 volts will rate something heavier, such as the MPS-A42.

Putting It Together

First, use Fig. 3 and direct etching transfers (or your preferred method) to prepare the circuit board. Next, prepare the case by drilling the mounting holes (see below for details of Q1 mounting) and cutting clearance for the edge connector.

The etched and drilled board can be stuffed with abandon, except for the mounting of Q1. Dress Q1's leads as shown in Fig. 4 and proceed as follows: With the exception of Q1 and miscellaneous wires, all parts should first be assembled to the PC board. Special care must be taken with Q1 at this point to ensure a stress-free assembly of the PC board, transistor, and case. Assemble Q1 and solder in place.

The PC board—with Q1 soldered in position—is mounted on the lower half of the box. Use spacers on the 4-40 screws as specified. The fasteners can be finger-tightened to stabilize the board temporarily.

Bend and adjust the leads of Q1 so that the mounting surface is in firm contact with the box and mark the location of the mounting hole. Remove the board and set it aside.

Drill a 9/64 hole for Q1 as marked. This completes machining of the case.

Complete the board assembly by soldering hook-up wires (3" lengths) to the circuit-board eyelets for connections to chassis and edge connector.

Before reinstalling the finished board on the box half, apply a light coating of silicone heat-sink compound to the mica insulator, the back of the transistor case, and the area around the mounting hole on the box cover. Next, with the insulator located between Q1 and the chassis, press Q1 firmly into place and, using 4-40 hardware plus the supplied plastic washer under the nut, fasten lightly. Q1 must be attached to its mounting surface with the insulating hardware packaged with SK-3220.

It is important that Q1 be mounted with care. Mechanically, a good fit is required, and electrically, the mounting tab on Q1 will be at collector potential and therefore must be insulated from the chassis ground.

Pin	Function
A, N	Ground
B	Received data
C	Receive data flag
D	Request to send
M	Transmit data
2	+5 volts
1, 12	Ground

Table 1.

Complete the assembly by installing and wiring the edge connector and the loop connector receptacle. Take care when wiring the edge connector. Make a positive identification of each pin. Your computer's data-port chip will be directly connected to the project interface.

The interface is now ready for testing. *Incorrect wiring could damage your computer*; just follow the hook-up diagram and all will be well.

Testing the Interface

Warning! Open-loop supply voltages may exceed 150 volts. Before working with loop connections, be certain that related equipment is switched off.

Step 1 is a preliminary checkout and should be done before connection with the computer or the loop circuit is begun. First, check resistance from the +5 eyelet on the board to ground. This check should show an open circuit. A low reading that does not vary means that there is probably a construction or wiring error present.

Next, make a resistance check from ground to each loop connection and from ground to the mounting tab of Q1. All readings should indicate an open circuit. If the preliminary check is satisfactory, connect the interface to the loop.

The success of the next test will rely upon the presence of loop current. A stabilized 60 mA is optimum. If the loop current drops out, recheck the polarity by reversing the loop connections to the interface. If the loop current does not hold after checking polarity, the problem can most likely be traced to an error in component placement. If the loop current holds, it will be safe to assume that the loop-switching circuit is working.

Now plug in the interface at the user port and *then* switch on the power. Load and run the RTTY program.

A note about software. This project was designed with the KG3V package in mind. It is probable that software other than this will do as well or better. The KG3V program, however, is available free of charge and is in the public domain. The remainder of these test procedures will assume the KG3V software.

Select mode 0 and hit function key F1. Using a VOM, logic probe, or scope, check the potential on IC1, pin 12. This should be close to 5 volts. Check the potential on IC1,

pin 10. The voltage reading on this pin should drop briefly to zero when the space bar is depressed. This drop in voltage certifies the presence of space intervals.

Check the voltage on R9 at the optoisolator connection (IC3). The results should be the same as those seen on IC1, pin 12. Return the meter probe to IC1, pin 12. The voltage should drop to near zero when function key F1 is depressed. Go to pin 11. This reading should also be close to 5 volts. Failure to get the voltage readings as specified will point first to a solder bridge on the PC board and then to a defective IC.

If everything checks out, it may be assumed that the interface is in good working order. Fire up the RTTY station and tune in a RTTY signal.

In mode 0 (60 wpm) receive, you should "see" any incoming print that is on the local loop. If there is a problem, check the voltage drop across D1. This should read 5.1 volts. The voltage drop across R6 should be close to 3.7 volts. Check across pins 1 and 2 (pin 1 positive, pin 2 negative) for a drop of 1.2 volts. A zero reading here indicates that IC2 is defective.

Before replacing IC2, recheck the values of R6, D1, and the local loop current, which should be 60 mA when closed. If all is well, hit the F1 function key once more and enter some spaces with the space bar. A printer on the loop (turn it on) should show spaces.

Troubleshooting problems with character transmission are best started at the optoisolator side of R9. Look for 4.7 volts on space. The collector of Q3 should go to near zero during the space interval. The voltage drop across pins 1 and 2 of IC3 will be difficult to see without a scope, but it should be close to 1.2 volts.

If the problem persists, check the voltage across pins 4 and 5 of IC3. With no output from the computer, it should be close to 0.7 volts. A reading of zero indicates that IC3 or Q2 is defective. Keep in mind that the voltages around Q1 and Q2 are at local-loop potential during space intervals. If at this point trouble still persists, check the orientation of D3 and D4.

Q1 can be checked by measuring the voltage drop across the emitter and base. A correctly functioning device will develop close to 0.7 volts when the 60-mA holding current is present; the drop across the collecter and emitter will be very close to zero. During open loop periods, this latter voltage will approximate that of the open loop.

One last comment: The project interface will safely handle a loop-current level as high as 100 mA, but it should be avoided. ■

Parts List

Integrated Circuits			
U1	7400 quad 2-input NAND gate TTL	Jameco	$ .29
U2, 3	4N25 optoisolator	Jameco	1.38
Transistors			
Q1	SK-3220 high-voltage power output NPN	RCA	2.75
Q2	MPS-A42 high-voltage driver	Radio Shack	.69
Q3, 4	2N2222 general-purpose NPN	Jameco	.68
Diodes/Rectifiers			
D1	IN4733 5.1-V, 1-Watt zener	Jameco	.22
D2–5	IN4006 HV 1 Amp	Jameco	.88
Capacitors			
C1	.1-uF, 10-V tantalum	Radio Shack	.50
C2	.01-uF, 25-V disc	Radio Shack	.20
C3	.01-uF, 100-V disc	Radio Shack	.20
Resistors (1/4 Watt, 5%)			
R1	1 megohm	Radio Shack	.10
R2	4.7k	Radio Shack	.10
R3, 4	22k	Radio Shack	.20
R5, 8	100k	Radio Shack	.20
R6, 9	470 Ohms	Radio Shack	.20
R7	4.7k	Radio Shack	.10
Hardware			
J1	Mini-jack	Radio Shack 274-251	.40
J2	Multi-pin connector (Jones type) two-pin male*	Radio Shack 274-201	
	Two-pin female	Radio Shack 274-202	1.79
	6" x 6" blank copper circuit board	Radio Shack	2.19
	Direct-etching dry transfers	Radio Shack 276-1577	2.59
	GC Electronics Chassis Box #16-080 (5-1/8 x 3 x 1-1/4)	Shand Electronics	4.07
	12/24 PC edge connector with solder eye terminal	Jameco 12/24SE	3.95
	Seven 3" lengths of #22 solid copper hook-up wire 100' spool	Radio Shack 278-1295	2.19
	#4 solder lug		.10
	60/40 rosin core solder PC type BPO dispenser model DS-1	Fordham Radio	.79

*Required for loop only.

About Fasteners: The small quantity of fastening hardware required to hold this project together can no doubt be found in the nooks and crannies of most ham-radio workshops, and the cost will be nil. However, for those who are starting from scratch, the following items are available at hobby shops and hardware stores in small-quantity blister packs. Radio Shack catalog numbers are given here for these items. There will be plenty left for the next project.

64-3011 (14 pkg. #4-40 x 1/2 round-head machine screws)	.99
64-3018 (30 pkg. #4-40 machine hex nuts)	.99
Two 64-3024 (24 pkg. assorted spacers)	1.98
64-3022 (20 pkg. #4-40 flat washers)	.99
Nine #4-40 x 1/2 round-head machine screws	.45
Nine #4-40 machine nuts	.45
Two #4 flat washers	.10
Four #4 x 1/4 metal spacers	.40

CB-TO-10 METERS

We specialize in CB radio modification plans and hardware. Frequency and FM conversions, books, kits, repairs, high-performance accessories. Our 11th year! 16-page catalog, $2.

Transistors On The Bias

Remember the last time you designed a transistor amplifier? The pile of parts that didn't work? Wells ends all that with this Basic amplifier-designer program.

Number 5 on your Feedback card

If you are an electronics tinkerer and a part-time computer hacker, you need this computer program. It was developed to manipulate the myriad of formulas surrounding one of electronics' most common building-block circuits, the class-A common emitter amplifier (shown in Fig. 1). Because of the flexibility of the circuit, there are infinite combinations of components that will work perfectly well. But what happens to the input impedance if you change the value of R2? Or output impedance when R3 is changed? The value of a computer becomes quickly apparent when you want to play what-if games with the circuit.

To use the computer program, five pieces of information must be entered: transistor beta (h_{fe}), maximum power dissipation, the resistance of R2, the power-supply voltage, and the lowest operating frequency. The most obscure of the five is power dissipation. This may be based upon the maximum device dissipation (spec value) or the maximum that is desired in a specific circuit application. Selection is the user's choice. If you are not familiar with how dissipation values affect the circuit, then working with V_{ce} vs. I_c characteristic curves (Fig. 2) for a typical junction transistor will provide the necessary data.

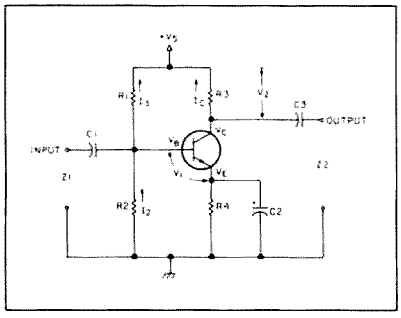

Fig. 1. Class-A common emitter amplifier.

The dotted line represents a constant power dissipation (Pd) and is determined by the product of V_{ce} and I_c at each intersecting point along the curve. All transistors have a maximum dissipation value, but it is not necessarily desirable to operate them at the maximum value in every circuit application. In fact, device reliability (and longevity) can be improved by operating to the left side of the maximum power dissipation curve established by the manufacturer.

Circuit Variables

The selection of maximum power dissipation and the power-supply voltage (V_s) will determine the dc loadline for the circuit. The loadline is like a railroad track in that it establishes an operating path for the transistor within the circuit. All transistor circuit voltages and currents intersect along the loadline, establishing the circuit operating parameters. As an example, a specific collector current and voltage drop between the collector and emitter of the transistor may be found at the loadline intersection with a specific base current value.

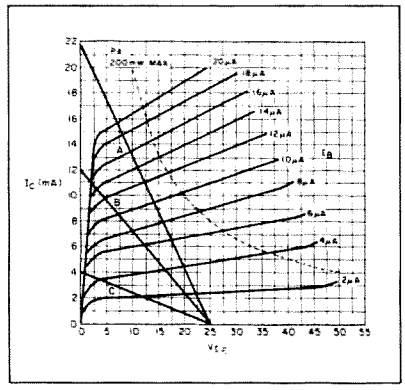

Fig. 2. V_{ce} vs. I_c characteristic curves.

For class-A amplifiers, the base current value is selected to provide a quiescent operating point (QOP) such that the collector voltage value will be one half of the power-supply voltage. Placing QOP at the point equal to one half V_s provides a nearly equal signal swing for both positive and negative signal excursions before peak amplitude distortion occurs. QOP is the zero-signal resting point on the loadline. Resistor R1 determines the base current value, which is used to establish the QOP position on the loadline.

The position of the loadline at location A, B, or C is selected by the amount of power dissipation chosen. Selecting one value over another is a matter of choice based upon various alternatives. In general, the lower the loadline is, the higher the input and output impedances will be. Obviously, though, circuit values are in parallel with the impedance of the respective circuit and will restrict the impedance range variation obtained.

Resistor R2 has the most direct effect on the input impedance, while R3 has the most effect on the output impedance. Signal linearity and gain also are affected by the loadline position. Lowering the loadline will tend to raise the transfer gain. However, signal linearity may be degraded. Therefore, how is the position of the loadline to be selected?

The usual way is to use the cut-and-try technique to work out the circuit values to achieve the desired results. Another technique is to examine the transistor curves and associated formulas to find the desirable circuit values for a given transistor and circuit application. With your help in selecting input data, the computer will work with the formulas, making circuit analysis very easy.

Before starting the analysis, choose a power dissipation value between 1/4 and 1/2 of the transistor's rated dissipation. Some circuits operate at 1/20 of the rated Pd, but in any case, the Pd is chosen to satisfy the cir-

Program listing.

cuit application. Typical transistors—such as 2N2222, 2N4401, 2N2907, and 2N4403—have a maximum power dissipation rating of 310 mW in free air. When properly heat-sinked, the 2N2222 will dissipate up to 1.8 Watts reliably. However, in most applications, the usual "free-air" dissipation is considerably less than 310 mW, allowing the circuit impedance to rise along with a reduced power-supply current drain. An advantage of the computer program is that a variety of circuit conditions may be examined quickly in order to find component values to meet the application requirements.

A value for R2 may be selected in many ways. However, the proper way would be to select it to be approximately twice the value of the desired input impedance. There is no real detriment to selecting an R2 value that is too high except that bias stability may be affected. If R2 is too low, the resulting low-input impedance (Z1) requires more drive power from the preceding circuit. However, the actual ratio of R2 current to base current is not critical as long as bias stability exists. By rule of thumb, current through R2 should be at least 10 times higher than I_B.

The Program

To keep the operator-entered data to a minimum, a few assumptions have been made. The first was to establish an emitter voltage at 10% of the power-supply voltage. Doing so allows the emitter resistor value to rise sufficiently for stable biasing and prevents thermal runaway. Thermal runaway may occur if the emitter-to-ground voltage value is allowed to approach the base-emitter voltage value (0.7 volts for silicon devices).

The second program assumption is that the application transfer gain will be approximately 60% of the device's beta value. The actual transfer gain can be found only by working with actual device curves and/or the h_{ie} parameter.

A third assumption involves the lowest frequency of operation. It is assumed that the reactance of each capacitor in the circuit will be nearly equal to its relative circuit impedance. Capacitor C1 would then have the same reactance as the input impedance at the lowest operating frequency, causing half of the input signal voltage to be dropped across the capacitor. The other half would be dropped across the amplifier's input. Capacitor value determination using this technique provides a calculated rolloff of about 3 dB (half power) or less at the lowest operating frequency.

The program was developed using generalized Basic to allow easy entry into the greatest number of types of computers. In addition, program variables are listed in Table 1, and remark statements are used abundantly within the program to help the user follow through the program steps. ■

No Free Lunches

The grail of perpetual motion has eluded scientists for thousands of years—are we on the brink of discovery?

Number 6 on your Feedback card

Beyond their practical involvement in technology, hams have very naturally maintained interest in the tenets of science and physics—in particular, those matters relating to the uses of energy. Without the various exploitations and transformations of energy, electricity and electronics would have remained but laboratory curiosities.

It is no wonder, then, that the patent office has long been plagued by alleged inventions of "free lunches"—the on-the-spot creation of energy and its corollary, perpetual motion. Surprisingly, however, this is not the exclusive realm of the ignorant, the irrational, or the scientific illiterate. When one probes beneath the superficialities of this subject, both quacks and eminent physicists are found in the mix. Indeed, there appears to be a gray area between the possible and the impossible wherein "practical" perpetual motion merits consideration even if the academic purist's version is unattainable.

For example, the nuclear derivation of energy from a pound of uranium so greatly exceeds the energy available from the combustion of a pound of coal that it is almost suggestive of magic. Compared to the more familiar energy processes, the nuclear utility station can be viewed as a practical approach to energy creation. Similarly, solar energy conversion systems operate for practical purposes, as if energy were being created.

We know, of course, that the pound of uranium—as well as the sun—must ultimately run down as a direct consequence of releasing its energy. So, even though "true" perpetual motion, or nondepleting energy, must remain a fantasy, untapped abundances in nature lure the adventurous in spirit, and it is not improbable that useful and practical compromises might result from seekers of the free lunch. Such things as fuel cells and vehicles operated from the kinetic energy stored in rapidly rotating flywheels come to mind.

Although the patent office automatically rejects perpetual-motion machines, it would accord an inventor an open-minded evaluation if only he would bring along a *demonstrable model*. A common excuse tendered by the alleged inventor of a perpetual-motion machine is that his prototype is not yet ready for demonstration because certain refinements must be made to eliminate unanticipated friction (see Fig. 1 for an example). How sad and how true! Let's look further into this matter and see what various free-lunch proponents and critics have said and done.

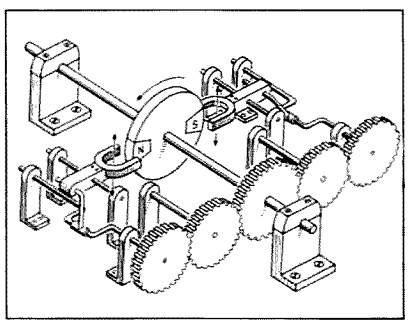

Fig. 1. Hitherto, attempts to secure continuous rotation in motors using only magnets have not been successful. An obstacle has been a condition of latchup wherein the arrangement quickly comes to a standstill after very limited motion. In this invention, a mechanical-feedback system is claimed to prevent such stoppage. The inventor promises to demonstrate such a self-running motor as soon as certain frictional losses can be reduced to a satisfactory level.

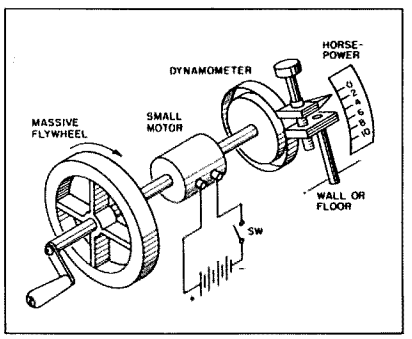

Fig. 2. The "Garabed," an alleged free-energy system. The claim and interpretation were predicated on the following demonstration: 1) The flywheel is manually set in rotation. 2) The switch, SW, is closed, energizing a small motor of 1/25 horsepower or so. 3) Because the small motor supplies frictional losses, the flywheel turns at a constant speed. 4) The dynamometer is adjusted so that the brake lining grips the rotating drum; it is observed that a maximum output indication of about 10 horsepower occurs briefly before the system comes to a halt. 5) Interpretation is made that 1/25 horsepower was multiplied to 10 horsepower as a manifestation of the "free energy" provided by the system. But, momentary high-power does not *mean that the output energy exceeds the total energy imparted to the flywheel.*

Gems of Wisdom From the Experts

A classical defense of the pursuit of perpetual motion and on-the-spot creation of energy stems from the obvious fact that there was once a first-time demonstration of the various inventions we now take for granted. Therefore, declare those who thus remind us of this, there will someday be a first-time demonstration of a perpetual-motion machine! And, though we may refute such statements with logical arguments, our position is likely to be weakened by reminders of past opinions voiced by experts who should have known better.

What makes such reminders particularly embarrassing is that these experts seem to have widely missed the mark in their own field of expertise. When the weatherman or the stockbroker calls the shots incorrectly, we tend to be tolerant and forgiving, but not so when the scientist gives us wrong directions. Yet, it is entirely possible for an expert in any field to cough up erroneous predictions. After all, we forget that whatever notable achievements underlie his fame and recognition, they were reached only after he discarded many mistaken judgments; we shouldn't be harsh with him for advancing just another mistaken judgment.

When Lord Kelvin was president of the Royal Society, he adamantly let it be known that "heavier-than-air flying machines are impossible." And a notable mathematician of the era ground out some elegant equations showing that such an accomplishment was indeed in violation of natural law. It was later found that his analysis also indicated that the bumblebee was incapable of flight. Fortunately, neither the bee nor the Wright brothers were versed in such high mathematics. And then Nobel prize winner Robert Millikan put to rest the hopes of forward-looking physicists by stating: "There is no likelihood

that man will ever tap the power of the atom." Topping both, the 1899 director of the U.S. patent office declared: "Everything that can be invented has been invented."

It obviously behooves us to be tough-minded in demanding proof of a claim that may strike us as far-fetched; at the same time, true open-mindedness is a requisite. Otherwise, it might be to our everlasting embarrassment that we failed to recognize an Edison or an Einstein because of our self-righteous notion of the possible and impossible. Even the charlatans and the self-deluded deserve due consideration; the practice will serve us in good stead when the real McCoy comes along.

The Garabed: Delusion Despite Sincerity

Perpetrators of fraud that many alleged inventors of perpetual motion are, some deserve credit as accomplished magicians; as with the stage magician who saws the pretty girl in half, it just ain't so! Often, there is a concealed colleague-in-crime turning a crank in another room, or there are hidden wires supplying the electrical energy, which seemingly originates from nothing.

Such was not the case with a notable proponent of free energy, Garabed Giragossian. This sincere, but scientifically deluded inventor claimed in 1917 that he had discovered a means of providing humanity with inexhaustible energy instantly available for any purpose. Because he mistrusted the patent office, he requested special protection from Congress instead of filing a patent. With the aid of influential supporters of his claim, the requested protection was granted in 1918 in the form of a public resolution. The resolution, however, was conditional on the premise that the free-energy device had to pass the scrutiny of an appointed commission of engineers and scientists. This it failed to do.

It is particularly interesting to examine the nature of Giragossian's machine, for his mistaken interpretations are commonly made in patent applications, and are continually encountered in basic science classrooms. The Giragossian machine was essentially a massive flywheel coupled to a tiny electric motor (see Fig. 2). The demonstration commenced by having an assistant turn a crank until the flywheel was turning at a respectable rate. Then the motor was turned on. Instead of gradually losing speed and ultimately stopping, the flywheel now proceeded to run continuously at a constant speed. This, of course, was because the tiny electric motor provided just the required power to overcome the frictional and windage losses, which otherwise would have slowly eroded the spinning motion of the flywheel.

So far, so good—no claims were made on this aspect of the machine, which incidentally was called the "Garabed." It was in the next step of the demonstration that this sincere, but miscalculating inventor purported to see evidence of free energy. With the flywheel spinning at a constant rate, he dumped its kinetic energy into a brake-type dynamometer, which briefly indicated about 10 horsepower. The flywheel, of course, quickly

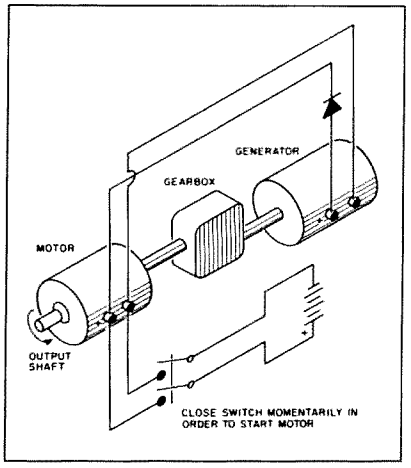

Fig. 3. A representative arrangement of motor-generator perpetual-motion systems. Hopefully, once the motor is operating, its continued operation will be sustained from the output of the generator. The switch, dc source, and the rectifier comprise the startup circuit. Hopefully, too, the gear box ascertains that the motor will be able to drive the generator fast enough to develop high output from the generator.

came to a standstill, having dissipated its energy into the frictional brake of the dynamometer. Giragossian's interpretation was that the Garabed had multiplied the output of the fractional horsepower motor to 10 horsepower.

High Power Does Not Always Imply High Energy

Where did the fervent and sincere Giragossian err? It was simply his inability to distinguish between energy and power. Most certainly, he did succeed in stepping up available power, which is the *rate of using energy*. We can do the same thing in charging a large capacitor from a low-power source of direct current. If we allow sufficient time for the capacitor to charge fully, a very powerful, but short-duration discharge can be produced by shorting its terminals.

Such a miniature lightning stroke does indeed develop more heat, light, sound, and air ionization (that is, more *power*) than might be had by shorting the terminals of the dc supply. Unfortunately, however, the charged capacitor is an inferior supplier of *energy* compared to the dc supply. As a matter of fact, it always turns out that about one-half of the energy supplied during charging is dissipated in whatever resistance may be involved in the charging circuit.

The manifestation of high power by itself does not suffice to identify it as a source of high energy; what may be lacking is the capability of delivering high power over an *extended period of time*. Both the capacitor and Giragossan's flywheel fail in this respect because they quickly lose their power-generating feature.

Another version of Giragossian's approach to the free lunch involves an electric motor

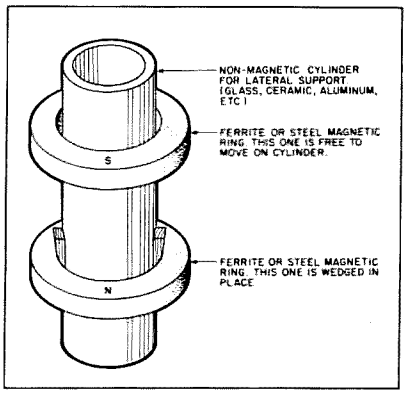

Fig. 4. A "food-for-thought" experiment. No external energy supply is needed for the levitated ring. The upper ring remains levitated indefinitely; neither ring looses magnetic strength. The constant repulsive force from the north poles of the magnetic rings overcomes gravity. If this experiment were simulated by electromagnets, it is obvious that electrical energy would have to be supplied (but only to overcome Ohmic resistance).

and generator system in which the motor is supposed to drive the generator, which in turn powers the motor, which in turn drives the generator, etc. Not only is it hoped that the system will sustain its own operation, but it is supposed to also deliver useful work to the external environment.

Sometimes elaborate gear trains are imposed between motor and generator so that the increased speed of the generator will suffice to overcome frictional losses. But, no matter how such inventors fool around, they ultimately find they cannot fool nature and her immutable laws. In simple language, the energy output of a machine is always less than the energy input.

It is truly remarkable how much energy pursuers of the free lunch will expend to defeat nature's energy law. Before the electrical age, the popular approach to perpetual motion was some manner of unbalanced wheel; in the process of turning, a wheel would somehow experience continual disturbances in weight acting around its rim so that a turning torque was continually applied (see Fig. 3). No contraption of this kind ever remained in sustained motion. Indeed, the more mechanical sophistications applied, the more inherent friction was incurred and the quicker the wheel ground to its inevitable halt!

Mad Inventors or Optimists?

It is always profitable to try to see the other fellow's point of view. What motivates the seeker of the free lunch? Aside from the hoaxer, it turns out that this field may indeed be worthy of study, effort, and experimentation.

Consider, for example, some means of liberating the energy of atomic nuclei that does not also liberate a host of radioactive isotopes, as happens in nuclear fision. Such an accomplishment would make available

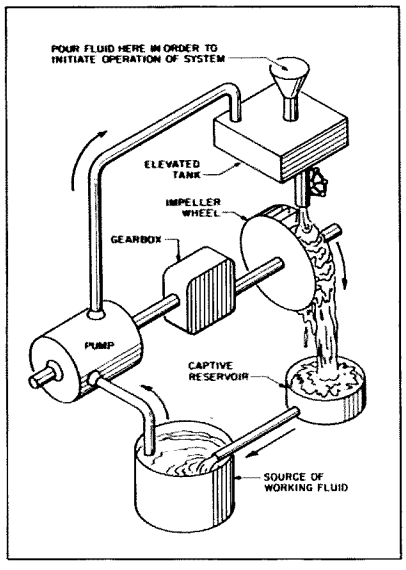

Fig. 5. Basic theme of many hydraulic perpetual-motion systems. Operation of a closed-cycle system is supposed to be self-sustained after initial startup. The gear box represents inventor's attempt to obtain more vigorous pumping action, thereby "fooling" the system to overcome its losses.

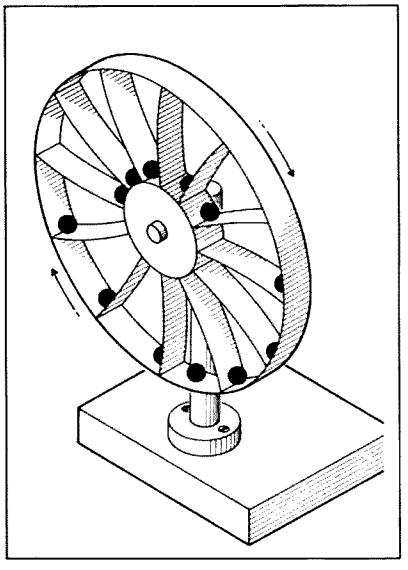

Fig. 6. Perpetual-motion wheel for providing free energy from gravity. This is a typical application of the unbalanced or over-balanced wheel. The radius arm of the steel balls is supposed to shift in such a manner as to keep the wheel turning.

tremendous amounts of usable energy in a relatively clean process.

This is exactly what is being sought in the fusion-technique experiments presently being carried out. If they are successful, it will be possible to extract much of the world's energy from sea water. From a practical standpoint, such an accomplishment will certainly be an *almost*-free lunch. Who knows, perhaps some obscure inventor may come up with an alternate, but simpler means of bringing about fusion than the elaborate systems presently being investigated by teams of eminent scientists?

It is understandable that would-be inventors of nearly free-lunch machines might be misled by statements of definitions commonly found in technological texts. For example, the formula Efficiency = Output Power/(Input Power + Losses) is usually OK in the context in which it is used. It might, however, be better to replace the word power with "energy," in which case there could be no misinterpretation. The possible trouble with the power equation is that it does not involve *time*, as does energy. This allows one to deal with a hypothetical system or machine in which a large peak, or short-duration power, is available at the output, thereby creating the illusion that the operation exceeds 100%.

The Lure of Magnets

Magnets and magnetism have long exerted an irresistible mystique for the pursuers of inexhaustible energy or motion. Indeed, several simple manifestations of magnetism are not easily explained to the satisfaction of those who purport to see possibilities beyond already attained achievements. An electric generator delivers electrical energy as a consequence of the mechanical energy used in turning it. However, the intermediary function of magnetism is bothersome to some; particularly intriguing is the fact that a permanent magnet in a simple dc generator does not "run down." To those who think in this manner, the electrical energy seemingly is provided by the magnetic field, and the mechanical energy input to the generator just happens to be one way of extracting this energy via our crude technology.

Another aspect of magnetic behavior is the observation that a steel ball or roller will be drawn to a magnet, often with great force at the time of actual impact. Why, then, not arrange a circular pattern of magnets and rotating members to produce continuous rotation—a magnetic motor, so to speak? This turns out to be a real brain teaser, for no matter how the scheme is implemented, the rotational motion is short-lived. Obviously, something must be done at the instant of lockup in order to enable further rotation. But what?

Surprisingly, the publishers of *Science & Mechanics*, generally an excellent treatise on technology, featured on the cover of their Spring 1980 edition an artist's rendition of a remarkable home power-plant utilizing a 15-horsepower "magnetic motor" to drive a 5,000-Watt generator. The inventor actually received a patent for the underlying principle. Yet, such an scheme seems to violate fundamental precepts of physics, thermodynamics, and energy conservation. Were such a scheme and such a machine actually feasible, all aspects of modern civilization would undergo an instantaneous quantum jump in global living standards, the like of which has not yet been experienced or even imagined.

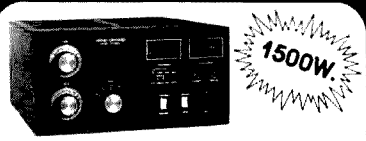
Finally, those who try to coax magic out of magnets are intrigued by the phenomenon of levitation. Put two magnetized rings of ferromagnetic material on a supportive rod of nonmagnetic material and, providing the fields are in opposition, one ring will remain indefinitely levitated above the other (see Fig. 4).

The classical explanation is that this is no big deal—no motion is involved, so no work is being done. However, the fact that the force of gravity is overcome by the interaction of the two fields points to a possible free lunch for those so inclined to see things that way. Here, the question as to why the magnetism is not depleted by the continuous "effort" may not engender a soul-satisfying answer.

Closed-Cycle Fluid Systems

The observation that falling water can pack a wallop harks back to an era when artificially kindled fire and the wheel were high technology. Not long after Archimedes invented a means of pumping water from a lower to a higher elevation, it was only natural for him to rig up a system that was supposed to operate in a self-sustaining manner. His scheme comprised the pump mechanically coupled to a water wheel. The pump was supposed to transport water to a higher level, whereupon it was allowed to fall on the water wheel, which then kept the pump going, as well as the entire system—it was hoped (see Fig. 5). But there was no cry of "Eureka!" for the contraption utterly frustrated this otherwise great intellect.

To give credit where due, Archimedes did devise a clever pump for his day. This consisted of a pipe in the shape of a helix. Dipping one end of the helix into a vessel of water and turning it would pump water to a higher level. Today, would-be inventors continue to repeat Archimedes' failed experiment using more sophisticated pumps, modern water wheels, gear boxes, and other components calculated to help fool nature. None, however, has yet been heard to exclaim, "Eureka!"



Unbalanced Wheels

If you spin the front wheel of an upside-down bicycle, the long duration of rotation can easily exceed expectation. What we have here is a finely balanced wheel pivoted on inordinately low friction bearings. Observations of this kind have long inspired seekers of perpetual motion to try to add some gimmick to such a wheel in order to enable it to turn indefinitely. The popular approach is to induce unbalance in such a way as to continually apply turning torque to the spokes or rim of such a wheel (see Fig. 6 for one example).

Much ingenuity has been displayed in such endeavors; yet each and every perpetual-motion wheel thus far built has disappointingly failed to make its inventor rich and famous. Indeed, a new law of nature has been suggested by such endeavors: The more elaborate the scheme for automatically unbalancing the tuning wheel, the more quickly it grinds to its inevitable halt!

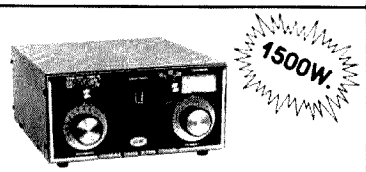
Although planets spin for eons and electrons apparently spin forever, wheels all too quickly respond to the dissipative effect of

B & W PRESENTS A WINNING COMBINATION

MODEL PT2500A LINEAR AMPLIFIER

The Barker & Williamson PT2500A Linear Amplifier is a completely self-contained table-top unit designed for continuous SSB, CW, RTTY, AM or ATV operation. Intended for coverage of all amateur bands between 1.8 MHz and 21 MHz, it can be readily modified for frequencies outside the amateur bands for commercial or military application. Two type 3-500z glass envelope triodes provide reliability and rapid turn-on time.

FEATURES INCLUDE:



- Full 1500 watt output
- Pi-network input for maximum drive
- Pressurized plenum cooling system
- DC antenna relay for hum-free operation
- Illuminated SWR and power meters
- Vernier tuning for accurate settings
- Pi-L output for greater harmonic attenuation

Ruggedly constructed of proven design, this amplifier reflects the manufacturer's critical attention to details—such as the silver-plated tank coil for maximum efficiency. Cathode zener fuse and internal/external cooling are among the protective and safety devices employed. Input and output impedances are 50 ohms.

Dimensions: 17" wide x 19" deep x 8"½ high
Weight: 80 lbs. (shipped in 3 cartons to meet UPS requirements)

Price: $2175.00 FOB factory. Price includes one year limited warranty.

Call or write factory for complete specifications.

MODEL VS1500A ANTENNA COUPLER

The Barker & Williamson VS1500A antenna coupler is designed to match virtually any receiver, transmitter or transceiver in the 160 to 10 meter range (1.8 to 30 MHz) with up to 1500 watts RF power to almost any antenna, including dipoles, inverted vees, verticals, mobile whips, beams, random wires and others, fed by coax cable, balanced lines or a single wire. A 1:4 balun is built in for connection to balanced lines.

FEATURES INCLUDE:

- Series parallel capacitor connection for greater harmonic attenuation.
- In-circuit wattmeter for continuous monitoring.
- Vernier tuning for easy adjustment.

Front panel switching allows rapid selection of antennas, or to an external dummy load, or permits bypassing the tuner.

Dimension (Approx.): 11" wide x 13" deep x 6" high
Weight: 6½ lbs.

Price: $499.00 FOB Factory. Fully warranted for one year. ✓53

friction. And sadly, even if all frictional forces could be eliminated, the spinning wheels could only give back the energy imparted to it when it was set in motion.

New Ideas and Oft Repeated Pitfalls

It is not enough to identify a source of energy and attempt to make it do useful work. Energy confers no benefit to us unless it is *available*. A warm mass of metal does indeed contain heat energy. But, such heat energy will not of its own accord flow to a hotter mass of metal. It is much like expecting a ball to roll uphill. If, however, the inventor arranges his apparatus so that there can be a flow of heat energy from a hot to a cold body, he is on the right track and may well come up with a new and useful machine or energy-conservation technique.

A stumbling block often overlooked by the enthusiastic would-be inventor is the nature of chemical reactions. All chemical reactions tend toward a stage of equilibrium wherein the reaction stops. When the equilibrium is attained quickly, you have the ingredients for an explosion; slower reactions enable such devices as batteries to be useful. A corollary of the equilibrium process is that the initial chemicals get "used up" or change their status in such a way as to be ultimately no longer available for providing energy. Thus, electric cells must be either replaced or recharged after a time.

Combustion, too, delivers just so much energy from the chemical fuels. Along with perpetual-motion machines, patents are often sought for alleged 400-mile-per-gallon carburetors. Of course, the bottom line to such inventions is that the major oil companies buy them up and keep them off the market! Although improved carburetors and fuel injectors constantly squeeze more efficiency from automobiles as the years go by, you can bet your boots that outlandish claims can be taken with a grain of salt.

Speaking of chemical reactions and automobiles, a continually "reinvented" panacea for the expense of fueling the automobile involves a hydrogen-operated engine in which the hydrogen is indirectly created by the engine itself. The basic idea is to have the engine drive a generator, which provides electric power to free hydrogen from water by electrolysis. So, you collect the hydrogen and burn it in the engine, which hopefully provides both motive power and the power to turn the generator.

Electrical and chemical systems are often manipulated by would-be inventors who would have the everyday horse sense not to pursue an analogous goal via a mechanical system. Thus, wheels with hinged weights to keep them forever in motion may loom up as obviously ridiculous. But in electrical and chemical systems, the link between cause and hoped-for effect is invisible or less obvious; a would-be inventor may become hoodwinked by the apparent sophistication of his violation of nature's laws. Not even the microprocessor or computer can be successfully deployed to fool nature. So, if the system in its most primitive form cannnot lift itself by its bootstraps, there is nothing to be gained from a program instructing it to do so.

Some Open-Minded Conclusions

If the would-be inventor's quest is not perpetual motion or free energy, but more bang for the buck, it is less easy to try to accuse him of chasing a pipe dream. For then, he can justifiably maintain that he is working in the realm of the possible and the practical. Consider such processes and techniques as geothermal sources of electric power, fuel-cell energy systems, and solar and wind electrical sources. These are all capable of providing "cheap lunches" in the quest for abundantly available energy. Moreover, they are not blue-sky projects; successful applications already exist and are giving good account of themselves.

In both technology and science, there are activities that resemble ordinary notions of perpetual motion or free energy, but upon closer scrutiny are found to either abide by natural laws of energy conservation or are more hypothesis than fact. For example, a resonant circuit cooled to near-zero temperature will oscillate indefinitely, or almost so.

But can energy be extracted from such a "tank"? It is indeed easy enough to tap such an energy source, but in so doing, the available energy will be depleted. This happens every time instrumentation is applied to ascertain that oscillation still exists. Therefore, such a cryrogenic resonant circuit, far from being a free-lunch energy source, is nothing more than a sophisticated storage system—like a battery, charged capacitor, or tank of water, it does not automatically replenish what it gives up.

In science, there is the hypothesis that the near vacuum of intergalactic space is not as benign as once supposed. Rather, energy can apparently arise from such apparent "nothingness." The reasoning underlying such "far-out" theorizing is more mathematical and esoteric than practical. The harnessing of such a cosmological source of energy probably had best be left to the Buck Rogers and Superman scenarios of space-age science, unless you are prepared to *demonstrate* your working model to the skeptics in the patent office.

Science, itself, is in a dilemma regarding the absolute integrity of the conservation of energy in the universe at large. Right now, effort is being expended trying to learn whether the proton of atoms has an infinite life span, or whether it, too, ultimately decays. In the meantime, there is little communication to the non-scientist bold enough to ask such questions as why the elementary particles of physics, such as the electron, spin without letup. Instead of holding their breath until really satisfying explanations of such enigmas are forthcoming, inspired inventors will continue their quest for unconventional energy sources. And, the smart ones will diplomatically refrain from presenting "free-energy" systems or "perpetual-motion" machines to the patent office—less friction will be provoked through the use of other words and phrases. ■

Subaudible Snooping

Track down subaudible access tones with KE6VK's low-frequency counter.

Number 7 on your Feedback card

The VHF and UHF amateur bands are filling up with repeaters, and many repeater owners are finding it necessary to require the use of subaudible tone encoders to access their repeaters. The design presented here is a counter which, when connected to a receiver, will display the frequency of the subaudible tone used by the transmitting station. Several special circuits have been designed into the counter to provide proper filtering of the desired tone and to allow a frequency resolution of 0.1 Hz in a counting interval of only 0.2 seconds.

The typical frequency range of subaudible tones is 67.0 Hz to 250.0 Hz, with an FM deviation of 0.5 kHz or less. This low value of deviation means that unwanted signals with higher deviations, such as speech, must be rejected. Also, the point at which the receiver audio is obtained must be prior to the low-frequency filters in the audio amplifiers to avoid unwanted rolloff.

Circuit Design

A block diagram of the counter is shown in Fig. 1. The input frequency is passed through a low-pass filter, a tunable bandpass filter, and then into a phase-locked loop consisting of a phase detector, voltage-controlled oscillator (vco), and frequency divider. The vco generates a frequency 100 times the input frequency, and this signal is used to tune the bandpass filter. The 100f frequency is then divided by two and used as the input to the counter. The counter time base allows the counter to count for 0.2 seconds, latches the result into the display, and resets the counter for the next counting interval. Counting a 50f frequency for 0.2 seconds results in a displayed frequency of 10f and, by moving the decimal point one digit to the left, we can display the frequency f with a resolution of 0.1 Hz.

Fig. 2 is the detailed circuit diagram. The audio enters at the input to U17A, which presents a high input impedance to the receiver and a low output impedance to drive the low-pass filter. U17B and U17C form a low-pass filter with a cutoff frequency of 300 Hz to provide rejection to speech. The bandpass filter, U18, is placed between the two low-pass sections and tunes itself to 1/100th of the frequency of the vco, automatically centering the filter at the desired frequency. The final amplifier section, U17D, is connected as a comparator.

U16 contains both the vco and the phase detector, and the frequency dividers are in U15. Up to this point in the circuit, the ICs all run from a regulated 8 volts from U6. Since the rest of the circuit operates at 5 volts, a level shifter using 1k and 1.8k resistors is necessary for proper interface. The time-base generator, U13, uses a 3.2768-MHz crystal and divides it down to 200 Hz. Another divider, U14, divides the 200 Hz down by 40, resulting in a timing period of 0.2 seconds. The function of U11A and U12 is to cause the display to update after 0.2 seconds, reset the counters (U7–U10), and reset the time-base divider chain (U13, U14).

The main counter chain is U7–U10, and it connects directly to the display ICs, U1–U4. The displays also contain integral latches and decoders as well as provisions for blanking and lighting decimal points. The left-hand decimal point on U4 is wired to be continuously on. The rest of the decimal points are wired to the output of U11B, which acts like a lock detector. When the phase-locked loop is out of lock, U11B will cause the decimal points to turn on or flash.

Operation

The Q of the bandpass filter (47) and the phase-locked-loop filter time constants were determined experimentally by trying to minimize lockup time and maximize rejection of voice modulation. The bandpass filter Q should be high to provide filtering, but low enough to allow some signal to the phase-locked loop when it is not locked. The present design locks up in about one second if the level of the subaudible tone is 0.5-kHz deviation. Do not be surprised if the display reads 120.0 Hz on stations with poorly filtered power supplies.

Interfacing and Adjustment

The time base may be measured in one of several ways. If a counter is available that will measure period, it can be connected to U14, pin 13 and the variable capacitor adjusted for .200000 seconds. Pin 12 of U11B should be grounded during this measurement. Another alignment method is to measure the frequency of the crystal at U12A, pin 10 and to adjust the frequency to 3.276800 MHz.

The power requirements are 12–14 volts at about 360 mA. Both voltage regulators should be mounted to a heat sink of four to six square inches to provide adequate cooling.

The audio connection to the receiver should be at the discriminator output or possibly just before the volume-control pot. Inspect the circuit carefully for circuits that would roll off the low-frequency response and connect the audio pickup ahead of these filters. Next, connect an oscilloscope to pin 2 of U18 and note if any limiting takes place when normal speech is received. The proper audio level is that which causes just occasional limiting on audio peaks. If the gain needs to be adjusted, change the value of the 100k resistor connected between pins 6 and 7 of U17A. More gain requires a higher value; a lower value will reduce the gain.

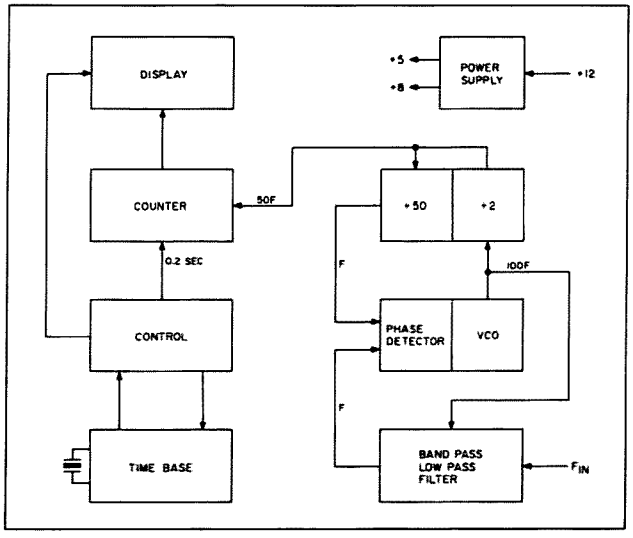

Fig. 1. Block diagram.

Conclusion

This subaudible tone counter will allow you to make on-the-air measurements of the tone frequency of a transmitting station. If the signal you are receiving is the output of a repeater, bear in mind that most repeaters will roll off the low frequencies and not retransmit them. The best results will be obtained if the station can be received directly. ■

A Pedal-Pushing Power Plant

The perfect way to work off all those beers at your next Field Day.

Number 8 on your Feedback card

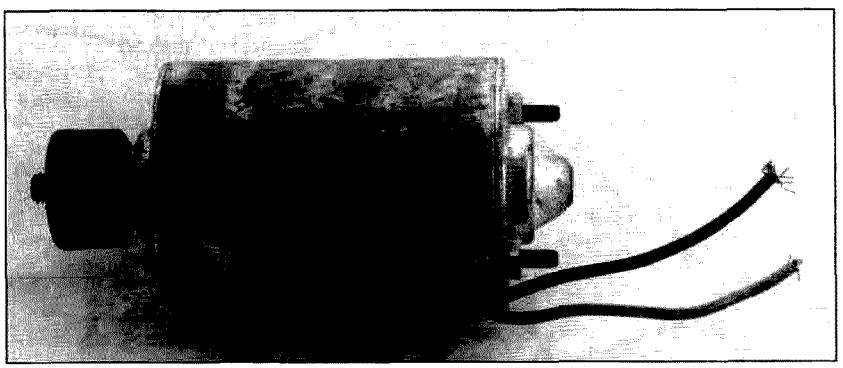

Photo A. The 1/10-horsepower, 12-V-dc bicycle pedal-assist motor.

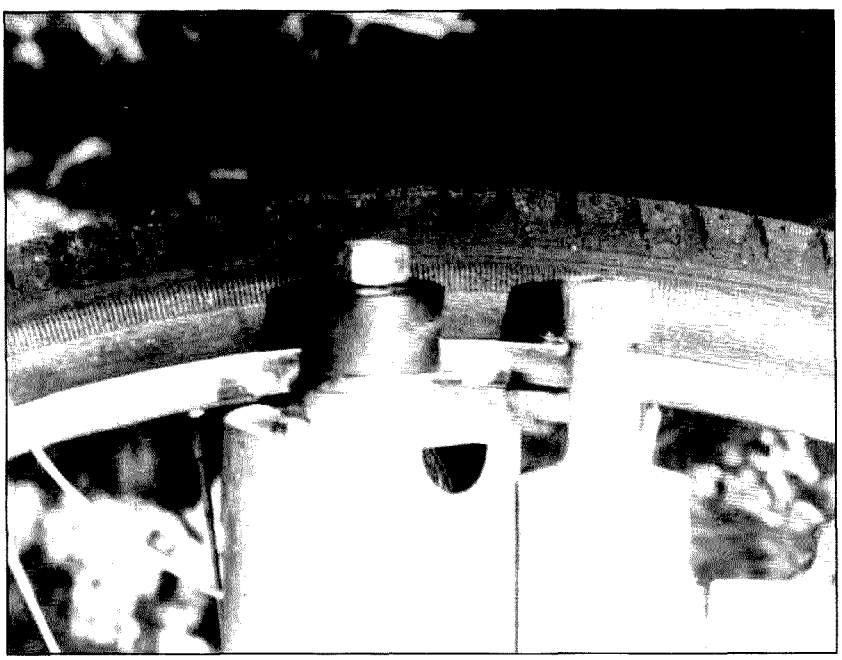

Photo B. The motor with the home-brew friction roller mounted against the bicycle tire rim. The smaller roller is the regular bicycle headlight generator.

Do you need an inexpensive source of 12-volt auxiliary power for emergency use, camping out, Field Day, and the like? I did, and I wanted to use my bicycle to generate the power. Regular automotive alternators were too heavy, cumbersome, and hard to crank using a bike. What I needed was something that would provide a steady 10 or 15 Watts for operating QRP or that could charge up a small lawn-tractor or motorcycle battery. I needed something that would run with a relatively easy cranking or pedaling effort, not the gut-busting level needed to keep a 50-Amp alternator turning. I remembered W2DNZ's stories about trying to keep a 100-Watt transmitter on the air with a bicycle-driven alternator with no battery backup. This sounded like a great way to get in shape for running the Boston Marathon wearing weights, or pedaling the *Gossamer Albatross* across the Atlantic with a stiff head wind, but not much fun for the weekend ham!

"There is no good reason I can see why this same approach wouldn't also work with small windmills, water wheels, etc. for other low-power installations."

How about the little ac generators that are commonly sold to run bicycle headlights? Some of the survivalist books recommend them as a source of power, mostly because they are so widely available. The inexpensive ones, though, provide only 6 to 8 volts for a few Watts—better than nothing at all but not very useful. Using a voltage doubler or even

tripler right off the ac generator might deliver enough voltage to charge up a stack of NiCd penlight cells to power an HT or small QRP rig, but at only a few mils of current it would take an awful lot of pedaling.

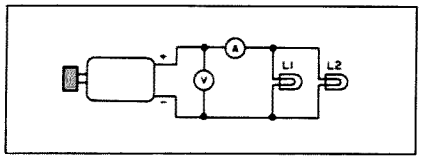

Fig. 1. Circuit used in the first test run.

What I needed was a compromise, something with more power than a bicycle generator, but not as big as a heavy-duty auto or truck alternator. Two possibilities suggested themselves: either a small alternator from a lawn tractor, snowmobile, or outboard motor, or a permanent-magnet dc motor running backwards as a generator. The small alternators seemed almost ideal, but availability and price were a problem. Also, they tended to have unusual gear or belt-driven hardware, and they required a battery backup for the field current. I looked at automotive windshield washer motors, but they were cumbersome because of their right-angle worm-gear drives.

The Motor

After much searching, I settled on a 1/10-horsepower, 12-V-dc, permanent-magnet motor manufactured by Bosch. It is a pedal-assist motor for bicycles and electric mopeds, though it also has wide applications in things like wheelchairs and hobby robots. This particular one was purchased for five dollars at a hamfest flea market, but the same or similar motors regularly are listed in the surplus catalogs of companies like Etco, Meshna, Fair Radio, Herbach & Rademan, and several others, usually for prices in the ten-dollar-and-under category.

The motor is built in a cylindrical case about four inches long and two and a half inches in diameter. Power is provided through a 5/16" threaded shaft 3/4" long at one end. The positive and negative leads are both isolated from the case and are brought out through an opening on the side. The rotation of the armature is reversible with the polarity of the applied dc.

A friction roller was made from a 1-1/4" diameter cylinder of hard rubber about 3/4" thick. This happened to be available as a rubber foot on a piece of surplus medical electronic equipment, but any small rubber roller would do. Another good possibility would be a small grinding wheel of the sort sold for electric drills, though this might tend to wear the bicycle tire out after a while. If this generator setup is to be used with a stationary bicycle (as opposed to one that can be ridden) then the rear wheel tire and tube should be removed, a small diameter pulley mounted on the motor shaft, and the armature belt-driven off the wheel rim. Another possibility would be a small-diameter chain sprocket driving a 2:1 or 3:1 surplus step-up reduction gear.

With the friction drive arrangement I used, the gears on the bike were set at their highest speed; the rear wheel was turning approximately four revolutions for every turn of the pedals. Adding in the diameter ratio between the 26" rear tire and the 1-1/4" friction wheel, the total turn ratio was on the order of 80:1. This meant that when the pedals were turned at a steady 40 or 50 rpm, the armature was spinning in the vicinity of 3,500 to 4,000 rpm, which is about the same speed that the armature runs when it is lightly loaded as a 12-V-dc motor.

The setup for the first test run is shown in Fig. 1. Automotive taillight bulbs were used as a load, with the filaments hooked up in parallel. An ammeter was placed in series with the load, and a voltmeter across it. The mechanical resistance of the generator was strong enough so that output varied considerably from one part of the pedal stroke to another. This is no problem with the bicycle actually in motion, as the inertia of the bike and rider is adequate to smooth things out. On a test stand, though, it is hard to get a steady enough output to read the meters (see Fig. 2).

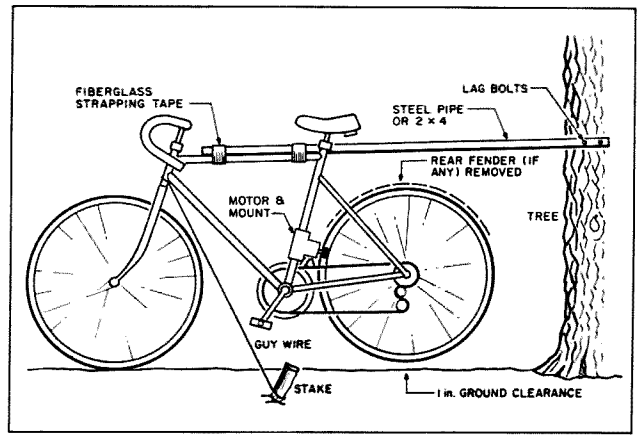

Fig. 2. The test stand. You may want to find a jockey to do the pedaling.

The circuit in Fig. 3 was then tried. A couple of 2,200-uF capacitors were put in parallel with the armature and the load. The capacitance acted as an electrical flywheel and also raised the average output voltage somewhat. By really cranking hard on the pedals, a peak output of about 3.5 to 3.8 Amps at just a tad under 12 volts was the best that could be sustained. For most low-power ham operations, 30 or 40 Watts at 12 volts is adequate, and if the average load can be scaled back to hold the generator output around 3 Amps, at the 30–35-Watt level, a comfortable rate of pedaling can be sustained—about the same effort as riding on level pavement.

However, 11.9 to 12.1 volts is just a little too low for charging up a 12-volt standby battery. A nominal 12-volt lead-acid battery needs around 13 volts or better for recharge, even more if a blocking diode is used. At-

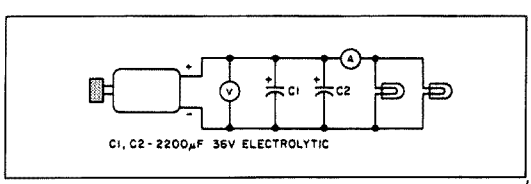

Fig. 3. Modified test circuit, with two 2,200-uF capacitors in parallel with the armature and the load.

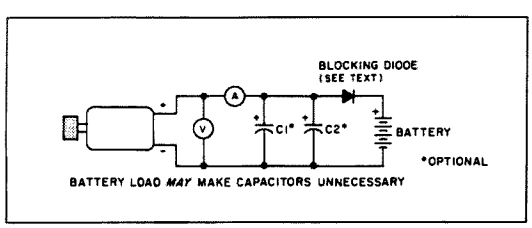

Fig. 4. Substitute a germanium diode for the silicon one and you can save a half volt or more because of the lower forward voltage drop.

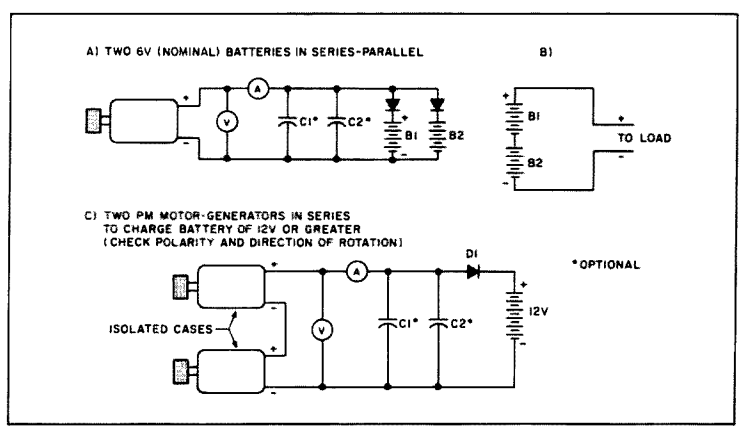

Fig. 5. (a) Two 6-V batteries in parallel while being recharged and (b) switched to series while in use. (c) Two motor generators in series.

WORK THE WORLD ON AN HT!

The RB-1 easily interfaces 2 transceivers. A 220 or 450 rig can interface to control a fixed station. By utilizing the squelch of the new TS 430 or IC-740, the HF bands can even be worked from the HT. UHF to VHF — VHF to HF.

•Simple to connect - all connectors supplied.
•Can be used as simple RPTR control.

REMOTE BASE INTERTIE

$49.95 + $3.00 shipping

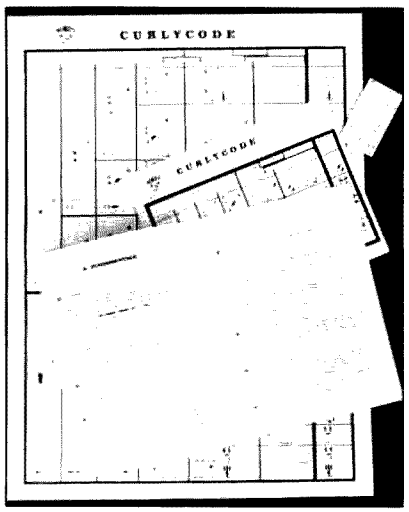
tempts to get the voltage up by cranking the pedals harder or reducing the load were not very successful; there was a definite "peaking out" effect around 12 volts. This was either because the windings and core of the armature were becoming saturated, or because the mechanical load resistance was causing the friction wheel to start slipping, or some combination of both.

A blocking diode is usually desirable when you're trying to recharge a battery; without one current will tend to flow back through the windings from the battery, and the generator will start acting like a motor again. The forward series voltage drop of the junction, usually on the order of 1.7 to 1.8 volts for a silicon diode, adds to the necessary voltage that must be provided by the generator to yield any meaningful amount of charging current. Taking a trick from the solar-cell people allows us to minimize this: Substitute a germanium diode for the silicon one and you can save a half volt or more because of the lower forward voltage drop. One junction of a germanium bipolar power transistor, such as the audio transistors used in many automotive broadcast radios in the late 50s, will do as well and will probably be easier to come up with in the station junk box (see Fig. 4).

If a 6–10-volt battery is adequate for your QRP and emergency power needs, this setup will be fine as is. If you really need a full 12 volts, you must resort to sneaky techniques. One possibility is to use a pair of motors as generators and put their outputs in series. If you try this, you must be careful to observe the correct polarity of output and direction of armature rotation. Also, be sure that both leads of the motors you are using are isolated from the case. If they aren't, some kind of insulated mount must be used. You may also find that two motors and two sets of friction drive rollers put a much heavier mechanical resistance on the pedals, and the output you can sustain at a comfortable level of pedaling effort may be reduced substantially—see Fig. 5(c).

A good compromise for many Field Day operations would be the arrangement shown in Fig. 5. Two 6-volt motorcycle or Gel-Cell type batteries are placed in parallel while being recharged, but are then switched to series to provide 12 volts while in use. The most practical arrangement would be to have four 6-volt batteries or banks of cells, so that one pair is always available to power the rig while the other is being charged up. Two blocking diodes act as load dividers to help maintain even charging rates in both banks of cells. If both banks have an identical internal resistance and are kept at the same charge level at all times, a single diode would be adequate.



There is no good reason I can see why this same approach wouldn't also work with small windmills, water wheels, etc. for other low-power installations. For the *truly lazy*, use a small gasoline moped or string-trimmer engine, thereby creating Putt-Putt Propulsion for the Pedal-Pushing Power Plant. ■

Holiday Buying Guide

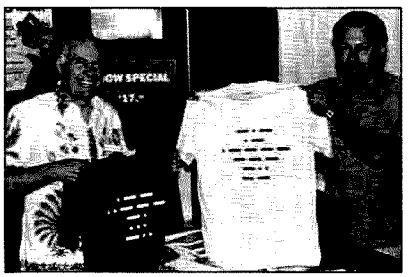
TRANS COM CN-1

Trans Com, Inc. offers the CN-1 Packet Connect Alarm. When a connection is made to your TNC, a one-second alarm sounds alerting you to the call. The CN-1 attaches easily to any model TAPR-compatible TNC with only three connections.

The CN-1 comes fully assembled and tested for $16.95; for more details, please check Reader Service number 251.

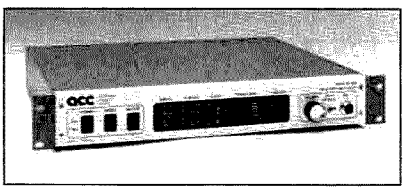
Curlycode from Mind's Eye Publications.

MIND'S EYE CURLYCODE



An unusual method for learning Morse code using rhythms and shapes is available from Mind's Eye Publications. Curlycode is a course designed either to teach code or to improve your code speed. The Curlycode system combines the rhythms of Morse code into shapes that are easily remembered; as you trace the shape you are tracing the outline of the letter being sent.

The basic Curlycode system costs $6.50, or $11.50 for the deluxe version, which includes wall charts and a handy pocket guide. Ten complete sets may be purchased at the discount rate of $91.50 including postage. For more information, check Reader Service number 252.



MORSE T-SHIRTS

Imagine your callsign emblazoned in Morse code across a red, light blue, orange, white, yellow, green, or black 100% cotton T-shirt. Choose fuzzy flock Morse characters in black, red, dark blue, or white. Sizes are men's small, medium, large, and extra large; all shirts are $14.50 plus $2.50 postage and handling (California residents please add 6% tax). Specify colors, size, and callsign (eight lines maximum).

For more information, check Reader Service number 253.

Fuzzy Morse T-shirts.

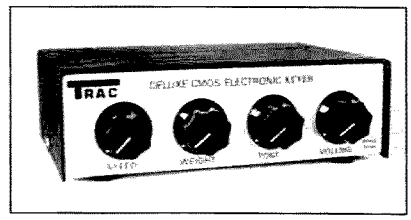
ACC's RC-850 repeater controller.

ADVANCED COMPUTER CONTROLS

Repeater Controllers

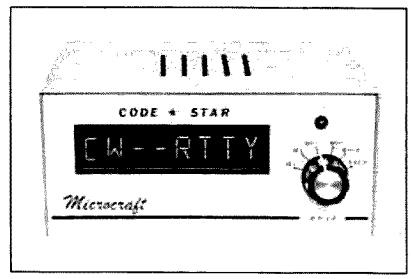
The RC-850 and RC-85 repeater controllers offer the advanced high-performance features that have made them the standard in amateur repeater operations. With the new ACC Digital Voice Recorder, repeater users can record voice messages for each other in a voice mailbox, and all of the repeaters' IDs and other messages can be stored. The ITC-32 Intelligent Touchtone™ Control Board provides extensive touchtone remote-control capabilities.

ShackMaster



ACC's ShackMaster multiplies the value of your home station by making it available for use from wherever you are. Crossband linking lets you operate your home HF station from your VHF hand-held, and telephone access lets you operate it from any telephone. Additional features include remote rotor control, a simplex autopatch, an intercom into the shack, and an electronic mailbox for communicating with the family.

For more information on ACC products, please check Reader Service number 254.



TRAC CMOS KEYER

The Trac Electronics model TE144 is just one of a full line of popular electronic keyers. The TE144 ($65.95) is a state-of-the-art CMOS keyer with self-completing dots and dashes, dot and dash memory, iambic keying, and speed, weight, tone, and volume controls. The keyer has its own sidetone and an internal speaker, and a rear-panel switch to allow semiautomatic or straight keying.

For more information on this and other Trac products, check Reader Service number 255.

The Trac model TE144 CMOS keyer.

Microcraft's Code★Star CW/RTTY/ASCII reader.

MICROCRAFT CODE★STAR

Microcraft's Code★Star decodes incoming Morse, Baudot, and ASCII transmissions and displays them on its eight large LEDs. The microcomputer auto-tracks Morse from 3 to 70 wpm in two optimized ranges. An automatic gain control circuit provides up to 16 dB of gain to keep locked to signals under changing conditions.

An optional serial/parallel output kit is available which provides a 110/300-baud buffered port to drive an ASR-33 or a computer terminal.

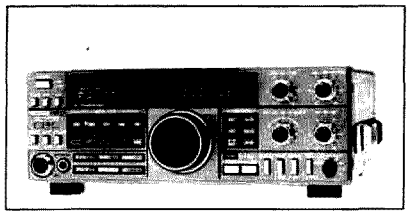
For more details, please check Reader Service number 256.

U.S. TOWER

U.S. Tower offers a wide variety of self-supporting towers for the radio amateur. Tower heights range from 33′ to 90′, and prices from $925 to $7,195. In addition to stock towers, the company is capable of building towers to your specifications.

For more information about U.S. Tower, check Reader Service number 257.

MFJ-949C VERSA TUNER II



MFJ is proud to introduce the model 949C Deluxe Versa Tuner II. The 949C will handle

300 Watts from 1.8 to 30 MHz, and will match coax, balanced feeds, or random wires. Swr can be easily read on the large cross-needle power meter. A 200-Watt 50-Ohm dummy load is included for interference-free tuneup.

For information on this and other MFJ products, please check number 258 on the Reader Service card.

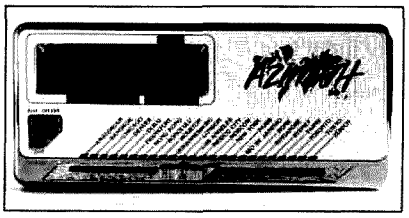
The MFJ-949C Versa Tuner II.

Kenwood's TS-440S.

KENWOOD

TS-440S

Kenwood's TS-440S HF transceiver features all-band, all-mode coverage, a 100-kHz–30-MHz general-coverage receiver, direct frequency entry from the keyboard, and a built-in antenna tuner for 80 to 10 meters. The exclusive DynaMix™ mixing system offers a true 102-dB dynamic range. 100 memory channels store frequency, band, and mode.



R-5000

The R-5000 high-performance receiver covers 100 kHz to 30 MHz in 30 bands, with additional coverage from 108 to 174 MHz (with the optional VC-20 converter installed). 100 memory channels are available for storing frequency, mode, and antenna information. Dual vfo's may be accessed directly with keyboard frequency entry. The R-5000 includes Kenwood's DynaMix mixing system for wide dynamic range, programmable scanning, and two built-in 24-hour clocks with timers.

TM-2570A

Choose one of three output power levels on 2 meters: the TM-2530A with 25 Watts, the TM-2550A with 45 Watts, or the TM-2570A with 70 Watts. All models feature 15 seven-digit telephone number memories, an auto-dialer, a high-performance GaAsFET front end, automatic repeater offset selection, and 23 memories which store frequency, offset, and subaudible tone information. Also available is the TM-3530A, a 25-Watt model for 220 MHz.

For more information about these and other Kenwood products, visit your local Kenwood dealer or check Reader Service number 259.

Azimuth's WT-80 World Time Clock.

AZIMUTH WORLD CLOCK

Azimuth Communication's new WT-80 World Time Clock features digital readouts with both local time and world time in a 24-hour format. The quartz clock operates from a single oscillator and uses a 24-position slide switch to show the time in 24 cities around the globe (UTC is displayed when London is selected). The clock also includes a button-operated light and a snooze alarm.

For more details, check Reader Service number 260.

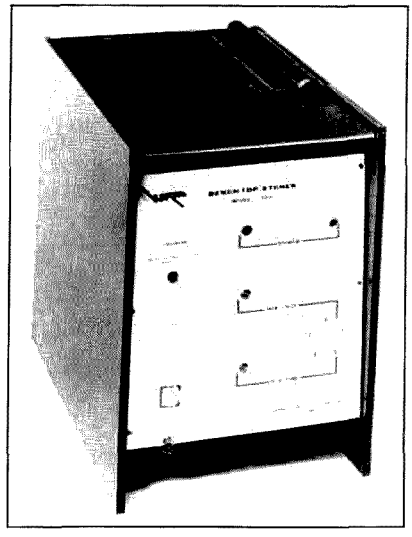
WENZEL COUNTER-MATE

The Wenzel Counter-Mate is a personal frequency standard which provides stable 1- and 10-MHz signals to calibrate frequency counters. A third-overtone 10-MHz crystal mounted in a proportionally controlled copper oven is used for very low drift. Outputs will drive both TTL and 50-Ohm loads with a 5-ns rise/fall time square wave.

To get more information on the Wenzel Counter-Mate, check Reader Service number 261.

MJC TECHNOLOGIES SCORE

The Sweepstakes Contest Operating Results Enhancer is billed as the ultimate ARRL Sweepstakes contesting system. The software, which runs on the IBM PC and compatibles, handles all of the logging and duping tasks associated with the contest. In addition, SCORE will directly control the Heath SS-9000 transceiver and Pro-Search rotor controls; frequency and antenna direction are automatically entered into the log.



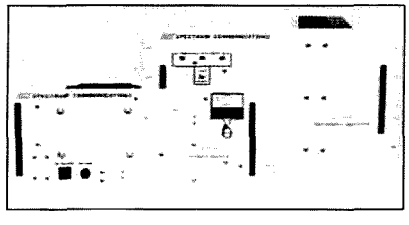
Real-time scoring information is displayed along with sections worked/needed. A variety of reports can be generated, including a complete log in callsign or contact order; a section-contact report, which lists the number of contacts for each ARRL section and the log information for the first contact in each section; an operating profile, which graphically displays band changes, QSO rates, and off periods; and a contest summary (required for Sweepstakes entries).

Demo disks are available to qualified clubs; for more details, please check Reader Service number 262.

TEXAS MAGNETICS

Texas Magnetics Corporation, the largest U.S. supplier of magnetic base assemblies for mobile antennas, is celebrating their 10th anniversary this year. TMC also manufactures Magna-Grab magnetic tool racks in two sizes; the TMC-100 is 13" long and the TMC-200 extends to 25". The racks are made of heavy-duty chrome-plated steel and are faced with a Kydex™ color bar. No assembly is required, and all mounting hardware is included.

For complete details on the Magna-Grab tool rack, check Reader Service number 263.



Kepro's bench-to-circuit etcher.

KEPRO PC ETCHER

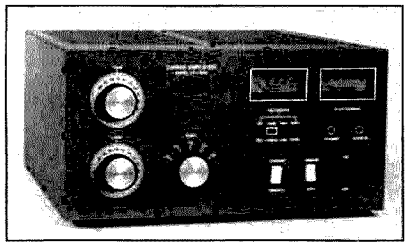
This holiday season, etch a permanent smile on your favorite electronic hobbyist's face with the convenient, versatile, and economical Kepro Spray Etcher ($765). He'll love you for it. And, with the professional results he'll get on PC boards up to 12" x 12" in just five minutes, you'll love his projects.

For more information on the Spray Etcher and other Kepro products, check Reader Service number 264.

SCA-100 VHF/UHF amps from Spectrum.

SPECTRUM POWER AMPS

The Spectrum SCA-100 150-Watt VHF and 100-Watt UHF amplifiers can be used with any 10–40-Watt transmitter. Their large heat sinks and high-efficiency design ensure cool operation even when run at 100% duty cycle in a hot environment. The amplifiers also feature automatic vswr protection and automatic amplifier bypassing if the power supply fails or the amp overheats. Both amps are designed for 19" rack mounting. A companion power supply, the SCP-30, is also available.



For complete details on these and other Spectrum products, check Reader Service number 265.

SYNTHETIC TEXTILES ANTENNA ROPE

Due to the constant urging of a local ham,

Synthetic Textiles has developed a special double-braided Dacron rope for use in antenna installations. The rope is available in three sizes: 3/32", 3/16", and 5/16". The outer braid is color-sealed black Dacron for resistance to ultraviolet light. The rope unties easily even after years of use and is easily cut with an electric hot-knife (included with every spool).

For additional information, please check Reader Service number 266.

The Barker & Williamson PT-2500A linear amplifier.

BARKER & WILLIAMSON

PT-2500A Linear

The Barker & Williamson PT-2500A linear amplifier is a completely self-contained tabletop unit designed for continuous SSB, CW, RTTY, AM, or ATV operation. A pair of Eimac fast-warmup tubes provide 1,500 Watts output on 1.8–21 MHz (the amp can be modified for use in military or commercial applications). Other features include illuminated swr and power meters, vernier tuning for quick accurate settings, and a silver-plated tank coil for maximum efficiency.

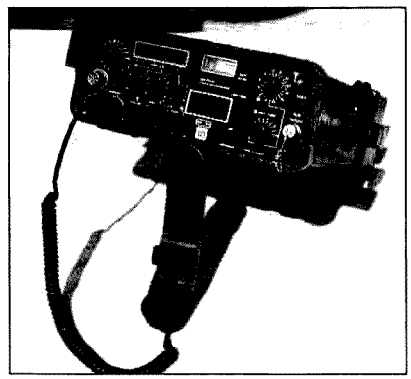
VS-1500A Antenna Coupler

The B&W VS-1500A is designed to match virtually any receiver, transmitter, or transceiver in the 160–10-meter range. The unit will deliver up to 1,500 Watts of rf to almost any antenna, including dipoles, inverted vees, verticals, mobile whips, beams, random wires, and so on, fed by coax, balanced lines, or a single wire.

Other features include a series/parallel capacitor connection for improved harmonic attenuation, an in-circuit wattmeter, and vernier tuning. Front-panel switching allows for rapid selection of antennas or a dummy load.

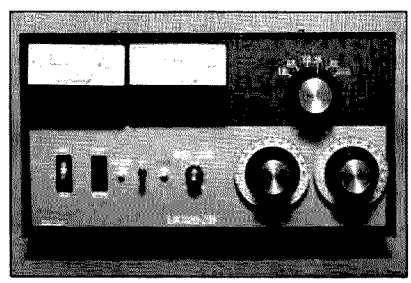
For details about these and other B&W products, please check Reader Service number 267.

MISSION CONSULTING



MP-25 Transceiver

Mission Consulting's MP-25 25-Watt SSB synthesized manpack transceiver covers the 2–15-MHz range in 100-Hz steps. This lightweight, immersible radio features a built-in antenna tuner and speaker, and meets MIL-STD-108. Several optional accessories are available for use in fixed operation.



Docking Booster

Boost the range of your HT while operating mobile by increasing its output to 30–50 Watts with Mission Consulting's Docking Booster. The Booster clips onto your car door and includes a microphone clip and an optional GaAsFET preamplifer. The Docking Booster is available for most ICOM, Yaesu, Kenwood, and Santec radios.

For additional details on these products, check Reader Service number 268.

Mission Consulting's MP-25 portable transceiver.

Amp Supply's LK500-ZB linear.

AMP SUPPLY LK500-ZB

This self-contained amplifier delivers 1,500 Watts of rf from 1.8–22 MHz and features a Peter Dahl Hipersil power transformer, an ITT Jennings vacuum antenna-changeover relay, and a companion sealed-relay QSK system. The HF tank coil and Centralab bandswitch are silver-plated. A no-tuneup version of the LK500, the LK500-NTB, is also available.

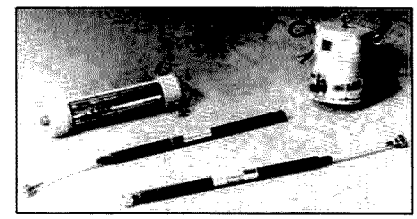
For further details on Amp Supply linears and accessories, circle Reader Service number 269.

CERTIFIED COMMUNICATIONS

Press Jones N8UG of Certified Communications supplies all of the wire and cable needed by hams. Certified also carries accessories such as insulators, connectors, baluns, ground rods, toroids, and so on. Custom baluns, feedlines, and center insulators can be made to order. Over 3,000 CB-to-10 conversions are in Certified's files.

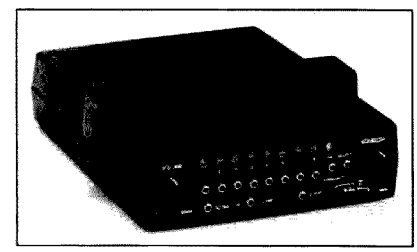
For more information, please check Reader Service number 270.

RADIO WORKS



B and C Series Baluns

Radio Works' B and C series baluns, in either 4:1 or 1:1 versions, achieve a balance of wiring inductance, core characteristics, coupling, and construction to produce a well-behaved broadband balun. Prices start at $15.95.

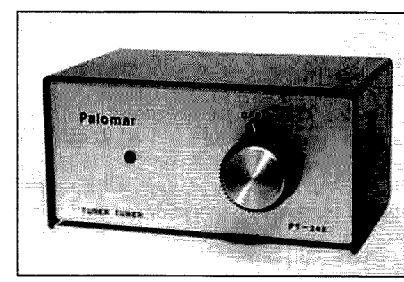


Superloop

The Superloop is a high-performance, automatic-bandswitching loop antenna for 80 and 40 meters. The design uses a decoupling stub in combination with a Dedicated Tuning Unit at the feedpoint for reactance control. The loop is slightly short of a full wave on 80 meters and exhibits gain on 40 meters and higher bands.

A free 32-page catalog is available from Radio Works; check Reader Service number 271.

New baluns from Radio Works.



The Regency R806 crystal-controlled scanner.

REGENCY R806 SCANNER

Regency's 8-channel R806 crystal-controlled scanner is ideal for listeners who don't need a fancy synthesized unit. The R806 covers 30–50 MHz, 144–174 MHz, and 440–512 MHz. Other features include a programmable priority control, dual scan speeds, and channel lockout. The scanner is designed for mobile or home use and comes with a mobile mounting bracket, an ac power cord, a dc power cord, and a telescoping antenna.

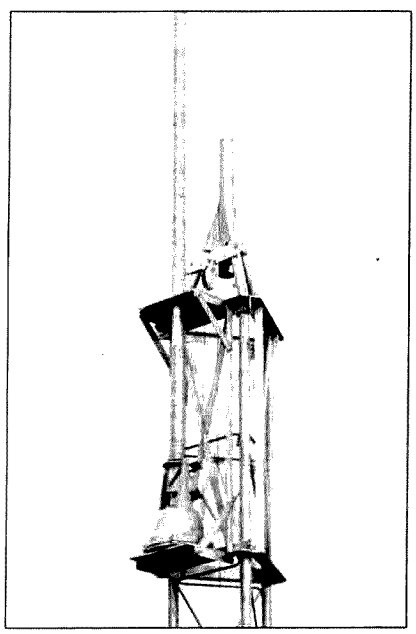
Get more information on Regency products by checking Reader Service number 272.

The Tuner Tuner from Palomar.

PALOMAR TUNER TUNER

Palomar Engineers have announced their new Tuner Tuner™, which connects between

your transceiver and your antenna matching unit. With the Tuner Tuner you can adjust your AMU without putting a signal on the air. The built-in 50-Ohm noise bridge gives an audible null when the tuner matches the coax line to 1:1 swr.



For more information, please check Reader Service number 273.

PAC-COMM DR-100/DR-200

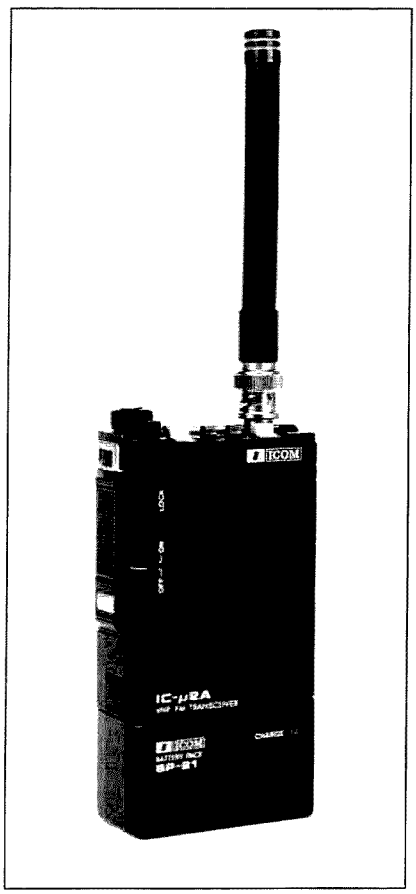
Pac-Comm is manufacturing packet repeater controllers designed expressly for the needs of packet radio networks and remote, unattended operation. The DR-100 provides a basic single-port controller useful for single-frequency digipeaters. The DR-200 is a dual-port controller designed to be an inexpensive, off-the-shelf packet switch for moving traffic on inter-LAN networks.

Both units are designed around the Z-80 CPU with up to 32K bytes of EPROM storage and 32K bytes of RAM. HDLC is handled by a Z-8530 Serial Communications Controller. The DR-200 has two independent 300/1200-baud modems (AMD 7910 World-Chip™), while the DR-100 has only one modem. Both models support an external terminal.

Several versions of single- or dual-port software are available at no cost through Pac-Comm. For more information, check Reader Service number 274.

The Hazer system.

MARTIN ENGINEERING HAZER



The Martin Hazer is a unique tower accessory that raises and lowers antennas directly up and down the tower. The Hazer is assembled at ground level. An antenna and rotor are fitted to the Hazer, then the entire assembly is winched to the top of the tower. A spring-loaded safety catch engages at every cross brace. At the top, the safety catch transfers the weight of the antenna to the tower.

For more details, check Reader Service number 275.

FOX TANGO ANNIVERSARY

To celebrate his 78th birthday and the 15th anniversary of the founding of Fox Tango, president Milt Lowens N4ML has announced a spectacular sale on his 8-pole FT Crystal Filters for radios from Kenwood, Yaesu, ICOM, Drake, and Collins. Milt bought a bunch of these when the Yen was low, and until the stock runs out he will pass the savings on to you.

For more information on Fox Tango filters, check Reader Service number 276.

ICOM's μ2A 2-meter hand-held.

ICOM MICRO 2AT

ICOM's new IC-μ2AT is a pocket-sized 2m hand-held designed to cover 139–174 MHz on receive and 140–150 MHz on transmit. The Micro features ten memories to store frequency, offset, and access tone; an LCD readout on the top panel; scanning; 1 Watt rf output; and 32 built-in subaudible tones. The HT weighs 1/2 pound and measures 2.3" x 5.6" x 1.1".

For complete details, please circle Reader Service number 277.

New 2400-baud TNC from Kantronics.

KANTRONICS

KPC-2400

The KPC-2400 Packet Communicator combines the KPC-2 300/1200-baud TNC with a 2400-baud PSK modem for high-speed packet operation. An RS-232C/TTL jumper is included to make interfacing to a terminal simple. An add-on modem is available for the TNC-1 and TNC-2 which mounts directly on top of the TNC. It adds 2400-baud packet to your station while maintaining 1200-baud operation. If you own a KPC-1 or KPC-2, Kantronics will take your old unit in trade for a new KPC-2400.

KPC-2

The KPC-2 Packet Communicator features a built-in HF modem, full duplex operation, multiple connects, and over 100 software commands. The unit comes with 128K of EPROM, 16K of RAM (expandable to 32K), and 4K of EEPROM. Any terminal program can be used with the KPC-2; Kantronics offers Pacterm programs for the Commodore VIC-20 and C-64, and the TRS-80 III, 4, and 4P.

For a free catalog of Kantronics equipment, check Reader Service number 278.

PETER DAHL

With a 516F2 Solid-State Conversion kit from the Peter Dahl Company, your power supply will run cooler and gain full protection against line transients. You get solid-state replacements for the 5U4 and 5R4 tubes, a silicon diode to replace the selenium bias rectifier, and a selenium transient suppressor.

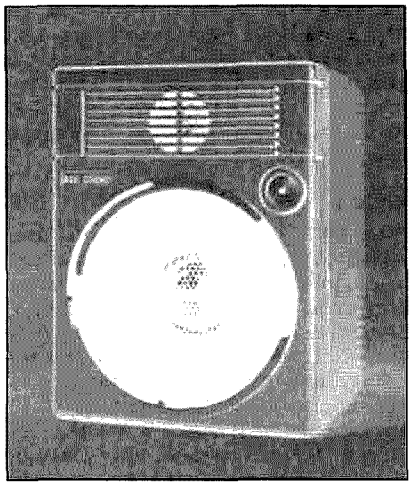
For more information on Peter Dahl products, check Reader Service number 279.

HEIL SOUND

SS-2 Magic Box

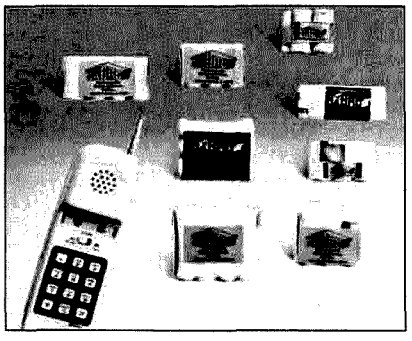
The Heil SS-2 system contains two 5-Watt amplifiers, a 3.5" air-suspension woofer with an 8-ounce magnet, and a 1.5" hard dome tweeter. Unlike the usual "hi-fi" speaker which has a crossover of about 7 kHz, the Heil SS-2 crossover is at 1.5 kHz, right in the articulate range of an SSB signal. The amplifiers have a 4-dB gain peak in the 1.5–2.5-kHz range to give extra punch to the audio.

Headset Control System



The HCS Headset Control System from Heil is designed for the serious radio operator. The HCS is made up of the BM-10 Boom Headset,

the HCS Interface Amplifier, and the PRS power supply.

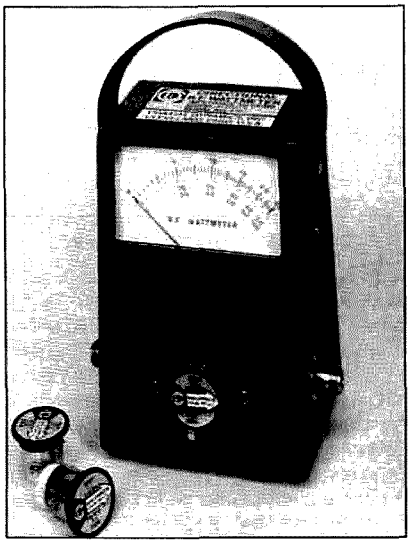


The BM-10 is specially designed for prolonged contesting. Weighing only 8 ounces, the headset can be used with one or two ear pieces and with or without the boom microphone. The microphone is an HC-4 DX Dream Machine and has a 10-dB peak at 2.1 kHz with a sharp rolloff (12 dB per octave) at 600 Hz.

The HCS Interface Amplifier contains a dual-channel 2-Watt audio amplifier with a two-input mixer. When used in stereo mode, one radio can be heard in the left ear and another radio in the right ear. An additional output allows a logger to listen in, and an intercom switch disconnects the radios to allow the operator to talk with the logger.

For more information on Heil Sound equipment, please check Reader Service number 280.

The SS-2 Magic Box from Heil Sound.

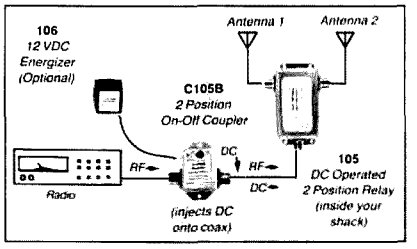


A variety of replacement nickel-cadmium batteries are available in JaBro's new catalog.

JABRO CATALOG

An updated 16-page catalog of replacement nickel-cadmium batteries is now available from JaBro. Additions to their line include replacements for the RCA Tac-Tec 747, Ritron's RT-156, and the Standard BP-11, as well as inserts for Midland models R70-B08 and R70-B12, the Repco 816 and 817, and Motorola's MH-70 and MH-10.

For more information, check Reader Service number 281.



Coaxial Dynamic's model 81000-A rf wattmeter.

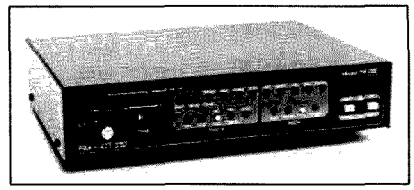
COAXIAL DYNAMICS

The model 81000-A Directional Rf Wattmeter is an inexpensive test instrument designed to measure forward or reverse power in coaxial transmission lines. Forty-seven standard and forty-seven special plug-in elements are available, covering power levels from 100 milliwatts to 5,000 Watts and frequencies from 2 MHz to 1,000 MHz. The 81000-A comes with N connectors, but any connector may be specified, including 7/8" silver flange. Maximum vswr is 1.05:1 with N connectors installed.

The 81000-A is one of a series of economical rf test equipment from Coaxial Dynamics; for more information, check Reader Service number 282.

Antennas Etc.'s remote switching system.

ANTENNAS ETC.



Baluns

Antennas Etc. offers a complete line of W2AU and W2DU baluns for both HF and VHF installations. Models are available to handle up to 9,000 Watts from 1.8–30 MHz and up to 4,000 Watts from 30–300 MHz in 1:1 and 4:1 configurations. W2AU ferrite-core baluns are $17.95, and W2DU non-ferrite baluns are $19.95.

Remote Switching

A remote switching system is available from Antennas Etc. which allows you to feed multiple antennas off of one coaxial feedline. The C105B system will handle up to 1250 Watts from 1.5–180 MHz, and uses a remote dc relay for switching.

For complete details on these products, please check Reader Service number 283.

AEA's PK-232 Pakratt.

AEA PK-232

The new AEA Pakratt model PK-232 is a multimode data controller with the ability to connect any RS-232-compatible computer or terminal directly to a transceiver. The PK-232's internal software handles the decoding, signal processing, and protocol for CW, Baudot, ASCII, AMTOR, and packet operation. Twenty-one front-panel indicators are used to display the operating mode and status.

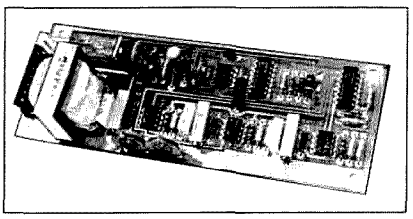
The PK-232 uses an eight-pole bandpass filter followed by a limiter discriminator with automatic threshold correction. The internal modem automatically selects the correct filter parameters.

For more information on the PK-232 and other AEA communication products, please circle Reader Service number 284.

The Alpha 78 from ETO.

ETO ALPHA 78

The ETO Alpha 78 is a self-contained HF linear power amplifier capable of 2,000 Watts PEP (SSB) or 1,000 Watts constant-carrier continuous operation. It is manually tunable from 1.8–2.0 and 3–22 MHz; four additional bandswitch positions provide no-tuneup operation at the full legal limit on 80–15 meters. The 78 is capable of QSK CW and features full-cabinet forced-air cooling with a ducted exhaust.



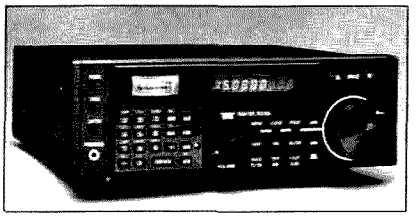
For more information, check Reader Service number 285.

UNTENNA HI-RIZER

The engineers at Untenna have taken a full-sized 40–10-meter vertical and wound it down to a manageable size: 15 inches. Three mounting options are available: a magnetic or clamp mount for use over a large metal surface and a ground screen. The ground screen is a 24" x 30" piece of hardware cloth and only acts as a ground plane on 15 and 10 meters.

20- or 40-meter operation is accomplished by using a 1/2-wave length of coaxial cable (furnished), making a 3/4-wave system on 40 meters and a 5/4-wave system on 20 meters. Tuning is done by tapping the helical radiating element and extending the two capacity-hat whips.

For more details on Untenna products, check Reader Service number 286.



Melco's Hi-Pro BAP.

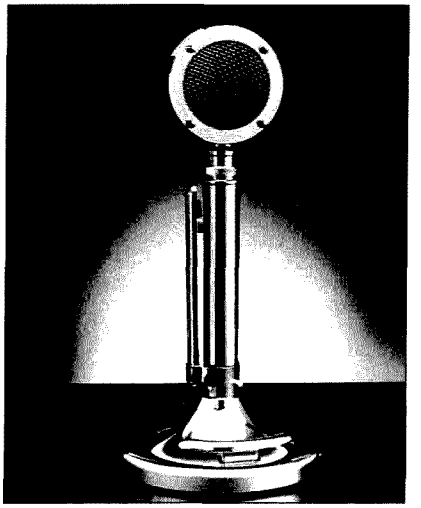
MELCO BAP

Maggiore Electronic Laboratory (Melco) now offers the Hi-Pro Basic Auto Patch, a single-board controller with all of the functions necessary to implement an auto patch. Features include an adjustable dual-tone two-digit decoder, an adjustable time-out timer, an external disable line, single-supply power, and full-duplex operation. The unit draws only 30 mA at 10–15 V dc.

For more information, please check Reader Service number 287.

Ten-Tec's RX325 general-coverage receiver.

TEN-TEC RX325



The RX325 is Ten-Tec's newest general-coverage receiver. The rig is fully synthesized from 300 kHz to 30 MHz and features 25 memories, an S-meter with a SINPO scale, a built-in rf preamp, programmable band and memory scanning, and 12 V dc or 120 V ac operation.

For more details, please check Reader Service number 288.

ASTATIC D-104 SILVER EAGLE

Astatic's D-104 Silver Eagle is the result of 50 years of research. It combines a vibrant chrome finish and engraving with a versatile microphone system. The D-104 Silver Eagle will make any rig look as good as it sounds.

For more details on Astatic products, check Reader Service number 289.

For the Santa envelope and fold-up card, send a first-class stamp only; envelopes will be provided. For more information, write to the club president, Robert J. O'Neil W1FHP, Hard Hill Road, Bethlehem CT 06751.

NEVER SAY DIE

from page 14

So, let me know if you actually need to have a contest to get you to fulfill your civic responsibilities and work some Novices. We can have the Work A Young Novice Event certificate, keeping you up all night over a weekend or two collecting Novice contacts. I think we'll get 'em more involved with amateur radio if you'll actually talk with them—maybe Elmer a little. Let 'em know hamming really is fun.

If you do this and it works—write. If you do it and it bombs for you—write. If you don't do it go soak your head and let me know how that feels. Soaking one's head isn't like it was when I was a kid and there was that rain barrel of icy cold water out by the back door. We saved the rain water to rinse out things—like thunder jugs. Know what they are? Or watering the garden.

What else can we do to help make hamming enough fun for Novices so they'll go for a General? Any ideas? We're working on a series of articles to help 'em understand how radio works—and electronics. With Bash gone, what'll we do—what'll we do?

HAM POVERTY

Not to beat this to death, but the more I read the business magazines, the more I find them echoing my sentiments. *INC* had a particularly interesting article on why blacks have fallen so far behind economically. Both the Asians and the Hispanics have zoomed way ahead of blacks in family income.

The article pointed out that one basic problem has to do with the black perception of success—a cultural problem. They look upon ministers, teachers, and government workers, rather than businessmen, as successes. Thus, instead of starting small businesses, blacks tend to go for low-paying, but to them more prestigious jobs.

Indeed, even when blacks go into business successfully they do not gain prestige in the eyes of other blacks. Blacks in business complain that their fellow blacks refuse to patronize them. You don't see that with Hispanics or Asians. These groups are very protective and supportive of their entrepreneurs.

When I visited Kenya and Uganda twenty years ago, I wondered why there were virtually no black-run small businesses. I talked about this with the local black people and found that blacks wouldn't support black-run stores, preferring to shop at Indian-run stores. Even when the black governments, in desperation, funded black business start-ups, they failed.

In my recollection no other group of American immigrants has done this to themselves. The Irish made sure that Irish-run businesses got their business—as did the Italians when they arrived—and the Jewish.

When you consider that half of the jobs in our country are in small businesses, and about 90% of the more recent new jobs are in this fast-growing sector, it's obvious that entrepreneurs and small business are by far the most important to nurture for the growth of our country.

We've been losing manufacturing jobs to lower-wage countries—and we'll lose more, no matter how the government finagles with protectionism. If it weren't for our keeping out foreign agricultural products and supporting the higher U.S. prices for food, we'd probably lose our farming industry, too. This has led to the ridiculous situation where Senator Dole, in order to protect his state's farmers, has forced the U.S. to pick up a good deal of the tab on wheat sent to Russia—which helps keep down the Russian costs of decimating Afghanistan and escalates our deficit by about $30 billion. Is Dole someone we're seriously considering for president?

So what does all this mean to you, the *73* reader? Well, unless you're already into being an entrepreneur, you're probably having to make tough decisions. As you get to be my age and the doom of retirement hangs over you, you're suddenly very aware of the miniscule dole you're going to get back for all those dollars you thought you were investing in Social Security. The government has been careful not to let it be widely known that this has been primarily a tax, not insurance. So, as Eisenhower put it, they've taken away your dollars and will give you back dollarettes. And not very many of 'em either. Great scam! Certainly you won't get enough so you can comfortably subscribe to *73, QST, CQ,* and *Ham Radio* every year. And not enough so you can join me for a few days on an occasional Caribbean DXpedition—or a fun trip to Asia.

Perhaps you've noticed that once women started working in larger numbers, generating two incomes per family, the prices of houses and cars adjusted to the higher family income—as has almost everything else. It's almost entirely the extra money from two-income families which has made it possible for most small businesses to get started.

You as an amateur have an edge on being an entrepreneur. First, your family income is way above average. Second, you have a better than average education. Third, you have a decided edge in technology, which is where the bulk of the opportunities lie for starting new businesses.

Unless you've wasted your opportunities as a ham to learn about electronics, you're in a great position to start a small spare-time business at home. I'd like to hear from readers who've done this so other *73* readers can get ideas. I know there's an almost infinite need for technicians able to repair computers. And that's sure easy to get into. First you buy your own computer. It will break (that's a guarantee). After you've sweated out your own you'll find friends begging you for help. Jump at it and learn all you can. Start passing the word—then perhaps your business card to local businesses. The next thing you know your kitchen, garage, and cellar will be piled with computers waiting for you to fix and your phone will be ringing day and night as frantic businessmen plead to get 'em back so they can keep their businesses going.

I've mentioned the enormous opportunities in security installations for homes and businesses. A new home business is developing in desktop publishing, where a $10,000 investment puts you into business.

If you're short on imagination you should be reading magazines such as *Success, INC, Business Week, Forbes,* and so on. They're filled with ideas. I also get ideas from reading the science magazines such as *Discover, Omni, Popular Science,* and so on. If I could find the support people to make things happen, I could get a hot new business started at least once a week. Sadly, finding people with the ability and enthusiasm to take an idea and make it work is extremely difficult.

Oh, I try. I recently mentioned a chap I hired who had every opportunity and blew it by building a large staff and endlessly planning, but no sales. Now he's mad at me because he was finally—after wasting several hundred thousand dollars—fired. Another chap was given one potential small business after another to start up—blew 'em all. Nice chap, but unable to either follow directions or replace them with intelligent decisions.

IBM AND APPLE USERS. $1 for latest listing of computer software and accessories direct from manufacturers. Programs, cabling, memory, and much more! Wentco, PO Box 81428, Cleveland OH 44181. BNB476

BUILD YOUR OWN SATELLITE DISH ANTENNA. Book provides pictures, illustrations, easy-to-follow instructions for 10.5-foot dish antenna. Also pertinent information for antennas with focal distance of .4, .45, and .5 is given for 10.5-, 20-, and 30-foot dishes. Send $12 to Power Gain Systems, Dept. D, PO Box 2955, West Monroe LA 71291. BNB477

WANTED: Old Western Electric, RCA, Radiotron, Mcintosh, Marantz, Dynaco, Telefunken, Tannoy, Altec—tubes, speakers, amplifiers. Maury Corb, 11122 Atwell, Houston TX 77096; (713)-728-4343. BNB479

FOR SALE: Kenwood 2-meter TR-7400 with built-in scanner; $160. Drake TR22C 2-meter mobile/portable with linear amp; $160. Wilson 2-meter hand-held with case/charger, immaculate; $140. Complete Collins S line, 7553 receiver, 3251 transmitter and power supply; $300. Nick Swan WB8ERN, 4839 Beaune Road, Ludington MI 49431; (616)-843-2162. BNB480

SCARA ANNUAL INDOOR FLEA MARKET. Date—Sunday, November 9, 1986. Time—Sellers, 7 a.m.; Buyers, 9 a.m. to 3 p.m. Place—North Haven Park and Recreation Center, North Haven, Connecticut. Price—Tables, $10 in advance (first come, first served); $15 at the door (if available); Buyers, $2. For information or table reservations, send SASE and phone number to: SCARA Flea Market, PO Box 81, North Haven CT 06473. Reservations must be received by Nov. 3, 1986. For information ONLY, from 7 p.m. to 10 p.m., contact Brad at (203)-265-6478. NO RESERVATIONS WILL BE TAKEN BY PHONE. BNB481

HAPPY THANKSGIVING from all the little Pilgrims at Junior High School 22 on Manhattan's Lower East Side. Send us your QSL today and we may send you our QSL OF THE WEEK AWARD just in time for showing off around the holiday table. Mail today to WB2JKJ. BNB483

TOOLS FOR HAMS: solder, soldering irons, coax strippers, pliers, test equipment, and more. Send for product and price list to: Jarrand Electronics WB2DEQ, 39-32 Brookside Avenue, Fair Lawn NJ 07410. BNB485

MORSE CODE practice cartridge for the Commodore 64 or VIC-20. Variable speed. Characters with Morse equivalent displayed on screen for you. $25 each. Call Jim at (318)-868-4233 or write to 331 East Southfield Road, Shreveport LA 71105. BNB486

ICOM IC-701 FOR SALE. Great condition in original boxes. Includes mic and manual. I'll even throw in a FaxScan Beeper III. $440. Call Perry KW1O at (603)-525-4201 days, or at (603)-547-2706 evenings. BNB487

RECEIVERS

The first three months of this column, of which this is number two, have one feature in common—there has not yet been time for reader input as to what subjects you would like to see discussed! When reader input gets thin, or nonexistent in the case of the first three columns, I will fall back to the "safe" strategy of discussing something of general interest.

For this month, the subject will be receivers. I might have started with antenna systems, but in the case of the VHF frequencies where most people are going to get started, antennas are fairly noncritical, at least for starters. The *Weather Satellite Handbook* describes several options for VHF satellite antennas, and even small two-meter antennas (3–5 elements) can be pressed into service to snag your first pictures. What you cannot fudge on is the receiver. Unless it meets certain minimum requirements, you may hear the satellite with a strong and consistent signal but you will *not* be able to get a decent picture.

To understand this seeming paradox, it is necessary to understand some aspects of the rf formats employed in weather satellite transmissions of potential interest to amateurs. All of the weather satellite transmissions you are likely to be interested in are transmitted in an FM format. When you choose a suitable FM receiver, the three primary criteria are sensitivity (noise figure), frequency coverage, and bandwidth.

Sensitivity/Noise Figure

Sensitivity is not a problem, despite the fact that we want the lowest practical noise figure, since an outstanding preamplifier can be added to any receiver that meets our other requirements. Modern GaAsFET preamplifiers for two meters (144–148 MHz) are available off the shelf with noise figures below 1 dB. Many of these are available in weatherproof housings for mounting at the antenna (a very good idea to eliminate the problem of transmission line losses). Virtually all of these can be retuned to cover the 137–138-MHz VHF satellite band, and many manufacturers will retune them for you when you place an order.

We will look at some available units in future columns, but the bottom line is that if you have a receiver that is suitable in other respects, noise figure/sensitivity can be brought up to any needed requirements very easily. Of course standard MOSFET and JFET preamps can be used as well. I would avoid bipolar preamps, as these have a tendency to overload, particularly in areas with a lot of rf crud.

Frequency Coverage

The frequency range of interest is fairly narrow, with all polar orbit transmissions confined to the 137–138-MHz range. U.S. TIROS/NOAA polar orbit transmissions are made on frequencies of 137.50 and 137.62 MHz. Each of the two operational spacecraft that are ideally in service at any one time will use one of these frequencies. NOAA-6, for example, uses 137.50, while NOAA-9 uses 137.62. Each has backup capability on the alternate frequency should a primary transmitter failure occur. Soviet METEOR/COSMOS weather satellite transmissions occur on a wider variety of frequencies.

In the past, 137.15 and 137.30 MHz were the two "prime" frequencies, and there still appears to be an operational METEOR spacecraft—and often more than one—on 137.30 MHz most of the time. In recent years 137.85 MHz has been used quite regularly, although other "oddball" frequencies in this range are active on an occasional basis. Whether this is by design or due to transmitter control problems is uncertain. In any case, your receiver must cover 137.50 and 137.62; 137.30 and 137.85 are desirable options.

Reception of geostationary WEFAX transmissions on 1691 and 1694.5 MHz (the latter used only by the European METEOSAT) is usually accomplished by using a converter ahead of the basic VHF FM satellite receiver. LO injection for the converter is adjusted so that the desired signal comes out at one of the "standard" VHF satellite frequencies (usually 137.50 MHz).

Bandwidth

Bandwidth turns out to be one of the biggest hurdles to overcome since all of the various satellites use deviation values that are significantly higher than those employed for standard FM voice links. The biggest market for FM receivers, if we leave out FM broadcast and TV sound, is for various kinds of scanners operating in the police and public-service bands. These transmissions typically deviate a maximum of ±7.5 kHz and the receivers are usually set up for 15-kHz bandwidth.

Unfortunately, if you tally up the values for signal deviation for a spacecraft such as the TIROS/NOAA series (±18 kHz) and Doppler shift (±3 kHz), you end up with a required bandwidth in excess of 40 kHz! A signal from one of the polar orbiters, received on a typical scanner with 15-kHz bandwidth, will be severely distorted and will not produce a usable signal. A straight carrier will sound fine, but a modulated signal is a mess. Although deviation levels are lower for the Soviet METEOR polar orbiters and the geostationary GOES and METEOSAT spacecraft, their signals are still too wide for satisfactory reception with a stock 15-kHz-bandwidth receiver. You would face exactly the same problem if you put a converter on an old two-meter receiver!

Receiver bandwidth is typically set by one or more filters in the i-f chain. There is almost always a crystal or ceramic filter at the 10.7-MHz first i-f and there is often another, usually ceramic, at the 455-kHz second i-f. If the receiver employs a crystal or ceramic filter at 10.7 MHz, it can often be widened by simply adding an inexpensive 30-kHz crystal filter in place of the original. A cheap 30-kHz filter will have very wide skirts and you will end up with a receiver with sufficient bandwidth to do the job. In contrast, a good 30-kHz filter will have steep skirts and the receiver will still be too sharp for TIROS/NOAA service.

The *WSH* provides some advice on crystal filter selection. If the receiver also uses a 455-kHz ceramic filter, you may have a problem since wider ceramic filters at this i-f frequency are harder to come by. I have had good success in some instances by simply replacing the 455-kHz filter with a small coupling capacitor.

Date	01 November 1986	
Spacecraft	NOAA-6	NOAA-9
Orbit Number	38192	9714
Eq. Crossing Time (UTC)	0105.71	0106.21
Longitude Asc. Node (Deg. W.)	99.23	152.74
Nodal Period (Min.)	101.127	102.0638
Frequency (MHz)	137.50	137.62

These orbital parameters are projected two months in advance due to deadline considerations. Accumulated errors due to uncompensated orbital decay and other anomalies result in expectation of errors up to two minutes and possibly as many degrees in terms of the crossing data and possible small changes in the indicated period. Users requiring precision tracking data should rely on more current sources.

Table 1. TIROS/NOAA orbital predict data.

Receiver Selection

In selecting a receiver, either off the shelf or for modification, the bandwidth factor should be foremost in your mind. In the sections that follow, I will outline some general strategies for receiver selection and modification. You should consult the *WSH* for more detailed coverage, including the addresses of the various vendors that will be noted.

Commercial Satellite Receivers

Obviously, the simplest approach is to buy a receiver designed for satellite reception. Models are available from vendors such as METSAT Products and Vanguard Labs. The most inexpensive options are crystal-controlled, and the crystal investment is quite modest since you will rarely want more than about four frequencies, unless you want to search for experimental Soviet spacecraft.

Kits

Your most economical option is to build a receiver from a kit. The number of VHF FM receiver kits available is now quite limited, but

fortunately Hamtronics still has several models, one of which is specifically broadbanded for satellite use. Such receivers are typically crystal-controlled.

Converter/Communications Receiver

Another possibility, not often considered, is to use a converter ahead of a communications receiver equipped with an optional FM i-f. If the FM option will provide sufficient bandwidth or can be modified, this approach can be very effective. The receiver will be tunable, but the high accuracy of most HF receiver vfo's will not present a problem in monitoring a specific frequency. You could modify a standard two-meter converter working into a 10-meter i-f (add a new LO crystal and retune), or you could contact companies like Spectrum International and have them modify a converter for you. Again, double-check the FM bandwidth specs; if the receiver is too narrow, you will get a strong but unusable signal!

Scanners

Now we come to the subject of scanner receivers! These beasts come in three general configurations: first-generation crystal-controlled units, programmable units covering the public-service bands, and wide-coverage programmable units.

Before I discuss each category, a few general guidelines are in order. First, if you are going to buy a new unit, insist on seeing a schematic. In the case of the Radio Shack receivers, such a schematic is usually in the manual, although you may need a magnifying glass to read it. The purpose of this step is to look at where the filters are located in the circuit. If you buy a used scanner, see if you can get a Sams Photofact sheet on it from your local electronics distributor.

Try to stick with units that employ standard i-f frequencies (10.7 MHz and 455 kHz), as you will have more luck in locating replacement filters to widen the bandwidth. I personally would avoid receivers that use other i-f frequencies. Ideally, try to get the dealer to open the case for you. Most will not, but try anyway. This will give you a chance to assess the mechanical aspects of filter replacement.

Crystal-controlled scanners are by far the simplest to work with. Generally the board layouts are more open, making it easier to get at the filters, and the VHF HI band (144–174 MHz) can usually be retuned to cover 137 MHz. Do not expect spectacular sensitivity since the front ends are designed for broadbanded service. But don't worry about it either since an external preamp will be needed in any case.

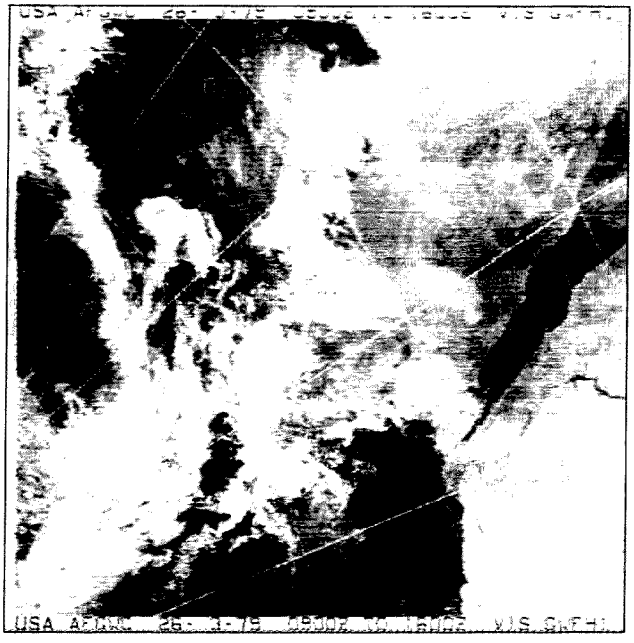

Photo A. Computer-formatted image of the Red Sea area, which was retransmitted through the GOES E spacecraft at 1691 MHz.

Programmable scanners designed strictly for public-service use present two problems. The first involves the tuning range. Most scanners are strictly limited to 144–174 MHz in the VHF HI range, and entering a 137-MHz satellite frequency will get you an error message of some sort. Two solutions are possible—setting the receiver on a frequency that provides high side injection for a satellite frequency and retuning the rf stages to peak at 137 MHz, or the use of a converter to convert the 137–138-MHz satellite band to a frequency range in the VHF LO band (usually 30–50 MHz).

The second problem, which concerns bandwidth, is preferred, but both options are described in the *WSH*. The PC boards of these receivers tend to be quite tight in layout, and actually getting at and replacing filters can be a problem. The degree of miniaturization makes it imperative to locate equally small replacement filters, and this can present difficulties. Here is where examining the circuit and looking into the unit can pay dividends prior to purchase!

The most impressive scanners of all are the wide-coverage units that represent the new generation of scanning receivers. A unit like the Regency MX5000, for example, will tune directly from 25 to 550 MHz in 5-kHz steps, features programming of AM, narrowband FM, and wideband FM for any channel, and has 20 memory channels with all sorts of fancy search options. A receiver of this sort looks ideal since there are no tuning problems and the wideband FM mode, designed for TV sound and FM broadcast use, is certainly wide enough for the satellite signal. Unfortunately, the wideband mode is *very* wide, resulting in a severe degradation of the signal-to-noise ratio (S/N).

A GaAsFET preamp at the VHF antenna will usually minimize noise and maximize signal to the point where a receiver of this sort is useful for polar orbit service, but geostationary WEFAX use presents a problem. Even a GaAsFET preamp for 1691 is significantly noisier than a unit for 137 MHz, and the only solution for boosting the signal without introducing more receiver noise is higher antenna gain.

You will have relatively poor results in trying to use a small (1.2-meter/4-foot) dish with such a receiver even though it delivers a satisfactory signal when used with a 30–40-kHz-bandwidth receiver. The system will work if you use a GaAsFET preamp and a larger (3-meter/10-foot) antenna such as a TVRO dish. But all of this adds to the expense of your system, not to mention the required antenna space. All such problems would disappear if the narrowband FM filters could be replaced with 30–40-kHz units, but the circuit board of a receiver like the MX5000 is packed to the limit with the smallest components you will see outside of an IC. I have no intention of attempting surgery on mine and I am usually quite casual about such modifications!

Receiver Modifications

Regardless of what approach you take to the station receiver, a few additional mods will be useful. The first concerns power supplies. A *very* well-regulated 12-V supply should be used. Scanner ac supplies almost always have an unacceptable hum level. You may not notice it on voice, but it *will* show up on pictures.

A second desirable modification is to provide a constant peak-amplitude audio tap from the receiver to your display system and tape recorder. This makes the video drive level independent of the receiver audio gain control and is quite handy. The easiest way to accomplish this is simply to tap off the top of the volume control (point furthest from ground) using a 0.1-uF disc or mylar capacitor, and then bring the line out to a phono jack at the rear of the receiver.

Trying It Out

Preliminary checks on the receiver can be made with a vertical quarter-wave antenna (51 cm/20 inches) connected directly to the antenna jack. With such a setup, you should be able to hear both TIROS/NOAA and Soviet METEOR spacecraft clearly during the best parts of a good pass. There will probably be considerable fading and noise, but you *will* hear the birds. For operational service, I would recommend the "Satellite Zapper" described in the *WSH*, preferably with a Vanguard Labs JFET preamp at the antenna or, better still, one of the newer GaAsFET units.

For the optimum in low-budget service, you can always clip a battery-operated receiver to your belt and hook up a 3–5 element two-meter beam. You can then stand in the backyard or on the roof and manually track the bird while piping the audio back to the station for recording. This approach is crude but extremely effective. You probably won't need a pre-

amp, given the fact that you have only a very short line to the antenna (a meter or so), and you can move the small antenna easily, rotating it to optimize polarization while monitoring the speaker or using a set of headphones. The neighbors will get a kick out of it, but it does work!

Picture of the Month

This little gem dates back to March, 1979. A failure of one of the early TIROS/NOAA satellites left NESS depending upon an Air Force weather satellite for polar orbit coverage. This particular image was computer-formatted and retransmitted through the GOES E spacecraft at 1691 MHz. To get the correct geographic perspective (N to the top), you should rotate the picture 90° to the right, although I will describe it as printed. The picture covers the eastern end of the Mediterranean. The Red Sea is very prominent on the right side, and the Nile River and Lake Nassar (behind the Aswan High Dam) are visible below it. One end of the Caspian Sea is visible at the top of the picture. The picture was printed on the facsimile recorder described in the *WSH*.

Next Month

Next month I will discuss some basic audio processing of the satellite signal from the receiver. This will be useful no matter what kind of display you will be using.

The *WSH* refers to the Third Edition of the *Weather Satellite Handbook*, available directly from the author for $12.50 postpaid in the United States and Canada and $14 elsewhere in the world. ■

TVI TROUBLE

Ol' Benjamin Franklin has always been a sort of hero of mine. When Ben wasn't over in Paris teaching the local female nobility how to French kiss, he was back home in Philadelphia devising witticisms. One of Dr. Franklin's all-time best sayings is "Nothing is certain in life but death and taxes," or something like that.

Ben obviously wasn't a ham, for if he were an advocate of the wireless arts, he would have known that television interference (TVI) is also one of life's certainties. Ben was born before TV was invented, so I guess we can forgive him for the omission.

Over the years I suppose I've generated just about every sort of interference that can be inflicted on a boob tube. I take pride in running a clean station, but when you live in New York City and have dozens of television antennas within a cat's whisker of your tribander, TVI is just impossible to avoid. I've gone through dozens of low-pass filters, and have given away enough high-pass filters to propel one major manufacturer of such devices onto the Fortune 500.

One year, I even pulled a Santa Claus routine. I dressed up like St. Nick, got a big brown sack, and handed out high-pass filters to the neighbors as if they were peppermint canes.

"Ho, ho, ho, little boy. MERRRRY CHRISTMAS. Here's a high-pass filter."

"Gee! Thanks, Santa. But I was hoping for an HW-101."

"Ho, ho, ho. Get lost, you little punk."

When the neighbors continued to complain about the interference I was causing, I thought I would wait until spring and dress up like the Easter Bunny. That way, I could carry additional filters from a beautifully decorated Easter basket. I thought better of the idea, however, figuring that two filters wouldn't be much more effective than one. Anyway, I don't look good in a bunny suit.

When I think about TVI, two stories immediately come to mind. The first is about the time I got a QSL card from a TV DXer in Dallas who said I was S9 +40 on channel 2 during a six-meter band opening. The more interesting story, however, concerns one of my first run-ins with an irate neighbor.

My TVI problems go back to the days before I was even a ham. In 1968 I was a CBer. In the golden days before CB hookers, 18-wheeled good buddies, and pinheads with affected southern drawls, the Citizens Band could be a lot of fun, even in a big city like New York. The bands were fairly empty, the chatter tended to be a lot more interesting than most ham QSOs, the equipment was cheap, and you didn't have to pass a code test. I was 14 and CB was a better way to BS with friends than to hang around the local candy store.

So, most evenings would find me in contact with my CB buddies, Morgan (Phantom), Jon (Willow), and Smitty, a mature 17-year-old who didn't need a CB handle and was sure his hypertension would let him beat the draft.

I was just telling Jon why I felt the "new" Nixon would beat the "old" Humphrey when my mother knocked. She opened my bedroom door a crack and said, "The neighbors are complaining again. Mr. Madden says you're coming in on his TV. Tone it down."

Since "tone it down" was my mother's euphemism for "shut off the rig" and since the conversation was just getting interesting (Jon was an HHH man, Morgan favored Wallace, and Smitty was an anarchist), I became furious. As it was, I had de-peaked my rig to about 100 milliwatts and was occasionally wiped out by a pizza delivery service located in a neighboring county.

"Tell Mr. Madden I'm coming over to talk to him, Mom," I shouted through the door. Jon, who had experienced TVI problems of his own, volunteered to come over to give moral support.

"The two of us will be a TVI committee, just like they're always writing about in *QST*," said Jon.

This wasn't my first encounter with Mr. Madden. He was a tough customer whom I had faced before. What made talking to Mr. Madden all the more difficult was the fact that he was stinking drunk all of the time. I mean, really stinking drunk. You could smell the guy a mile away. You could ignite his breath, and his general body odor wasn't the most pleasant either.

There was another thing about Mr. Madden: He was red. Not just a red-neck (although it was) or a redhead (although he did have red hair). I mean the guy's skin color was red. Beet red. The sort of red that made you think his eyeballs were going to pop out at any minute and spatter you with blood. Weird. Drunk and weird and red.

Still, he was a neighbor, and the FCC and ARRL both agreed that you should treat your neighbors courteously. Only I never remembered seeing anyone like Mr. Madden in any ARRL training film.

So, about a half an hour later, Jon and I knocked on Mr. Madden's door.

"Whooz dere?" said a wobbly voice from the other side.

"John Edwards," I replied. "You complained that I was interfering with your television."

The door opened a little, closed a little, and opened a little further. Mr. Madden was having trouble mastering the intricacies of portal operation.

"Ohhhh yezzzz. You. You'vvvv been coming over acrozzz my teeveee," he managed to get out. Like a true drunk, it was taking some time for his brain to comprehend and act upon the situation. Eventually, however, he realized that I was the foe who was interfering with the broadcasts of "The Flintstones" and he got angry, very angry.

"Nowww youuu loook here," he stammered. "I've taken jussst about all I'm goin' to, youu creep. Either you turn off that radio or I'mmm going to pop you."

Yipe! Fisticuffs! Being a devout coward, I pushed Jon in front of me.

"Say something, Jon," I said.

Jon, who had an uncanny knack of sizing up a situation instantly, said, "Sir, you are drunk."

Mr. Madden didn't say a word, he just hauled back and tried to push Jon's nose against his tonsils. Fortunately, since Mr. Madden was indeed drunk, he missed and splattered his knuckles into the door jamb.

Jon and I ran. We weren't going to wait for Mr. Madden to take a second swing.

Later that evening my father paid a visit to Mr. Madden. I don't remember if he took a shield, a suit of armor, or any hand grenades along. My father, however, was a British soldier during World War II and knew how to take care of himself.

"Son," said my father, "can that radio of yours transmit pictures?"

"No," I replied. "It doesn't make a very good helicopter, either. Why the stupid question?"

"Well, you see, when Mr. Madden claimed that you were com-

ing in on his TV, he really meant coming in—picture and all. In fact, he said he's seen you on 'The Carol Burnett Show' and 'Gomer Pyle.' "

What do you say to something like that? My father knew what to say. "I told him to complain to the FCC," my father reported. Good old fatherly common sense.

I don't know if Mr. Madden ever got around to writing his letter. The FCC never contacted me, and shortly after this unfortunate episode, Madden, his wife, and the two little Maddenettes moved out in the middle of the night. We never heard from them again, thank heavens.

Which just leads me to think, were my nightly TV appearances merely the result of an alcohol-ridden brain or were they a new, hitherto unreported type of TVI? Or, as Jon suggested, perhaps it had something to do with alien beings, UFOs, and the Bermuda Triangle.

Oh, well. I've always liked Rod Serling nearly as much as Ben Franklin. And, for some reason, my rig never interfered with the "Twilight Zone."■

RULES OF TEN

"Hams never build anymore!" That seems to be the battle cry. Well, if it were not for the AMers, packet people, and us QRP types, it might be ham radio's swan song. That's not to say others don't build; it's just that these groups seem to be soldering up something all the time.

At the Dayton Hamvention, people stand in line just to buy parts. I just don't believe that all those parts will end up as plastic paperweights. So equipment building still has a very strong foothold in ham radio. But Dayton happens only once a year. How do you get all the small parts needed for your next project? Well, there are always more hamfests, but no guarantee that what you'll need will be available. So, what to do? Without a doubt, mail-ordering parts is the way of building in the 1980s. It's a buyer's market, but also, buyers beware! I have a system that I call "Mike's Rules of Ten."

Sometime around 1975, there was a ham radio store that was doing some very bad mail-order business. One magazine took it upon itself to call attention to the problem. That magazine was *73*. There was a warning to new Novices seeking new equipment and, of course, to the parts buyers. What was the company? Trigger Electronics. Even with all the news about the dealings with Trigger, a lot of money was lost due to fraud. Yes, even I got bit, but using my Rules of Ten sure saved my money supply.

OK, just what are these rules of ten? Quite simply, this. When dealing for small parts with a new supplier, order only whatever is the minimum-order amount. This normally is about 10 bucks. When ordering small parts, like transistors, diodes, and the like, order in units of ten. This will save you money—sometimes as much as 30 cents on each part. Then wait ten days (working days) for the order. Using this method, I lost only 10 dollars to Trigger. Yes, I, too, sent copies of my cancelled check to the infamous "Miss Dolly," and several phone calls later was still without my order. So I lost 10 bucks, but it could have been much worse.

Now that my Rules of Ten are common knowledge, what is the best mail-order house and what's the worst? Well, I'm going to stick my neck out on this one. I have made up a list of some of the people I have done business with. Since these are only my opinions, don't send hate mail to *73* but to me. Perhaps someone may have some bad tales to tell about one of the vendors that I like. Also, if you have had good service from a parts vendor, send me the company name and ordering requirements. I would like to expand the list. Meanwhile, here is what I have now, with each vendor rated on a one-to-ten scale, with ten being the best, of course. Again, these are only my opinions.

First on my list is All Electronics Corp. While they have several walk-in stores, all mail orders should go to PO Box 20406, Los Angeles CA 90006. They have a 10-dollar minimum for orders and will take plastic money but no CODs. They sell surplus goodies, new small parts, wire, switches, etc. They have a fine catalog that's free; send for it. They also have very fast service, so they get a 7 on my scale.

Back in 1974, a vendor started to show up in this magazine. Its ad style is still copied today. At that time it was called "James Electronics." Today we know them as Jameco (1355 Shoreway Road, Belmont CA 94002). Primarily selling IC chips and computer parts and accessories, they have become THE source for components. While the minimum order is now 20 dollars, they do accept plastic money. A new catalog costs a buck. A top-rate vendor, they get a 10.

What Jameco is to ICs, Circuit Specialist Co. is to small rf parts. A free catalog may be had by writing to PO Box 3047, Scottsdale AZ 85257. Here is a QRP builder's dream come true. Aside from the usual offerings of transistors and IC chips, Circuit Specialist also offers a vast supply of rf chokes, chassis, PC-mount air-variable capacitors, and meters, just to name a few items. But perhaps the best news, there is no minimum order amount when a check or money order accompanies the order. Yes, they do take plastic money but then there is a 15-dollar minimum. A super vendor, they get a 10.

I can't think where you might be located without one of these stores nearby—Radio Shack. They are one of the very few places left where you can walk in and get some parts. The only trouble is that they may have discontinued the part or simply are out of it. Their prices may be a bit out of line, but on a late Saturday night when you really need that one part to finish up your project, you'll pay the price. Get to know the people who work at your local Shack. They will sometimes alert you to possible advance sales on the parts. Given all of this, the old "Shack" gets a 5.

JDR Microdevices, 1224 S. Bascom Avenue, San Jose CA 95128, is a clone of Jameco. Not connected in any way, their ads look very similar. Computer parts, integrated circuits for the hobbyist, and those hard-to-find computer chips comprise the bulk of JDR's business. A 10-dollar minimum order is needed. Plastic money is also fine to use. They don't have a catalog proper, but advertise monthly in magazines. A very fine vendor, fast service, and friendly people, they rate a 9.

Mouser Electronics, 11433 Woodside Avenue, Santee CA 92071, reminds me of the old Allied Electronics. Their catalog looks very much the same, only smaller. They sell everything from soup to nuts. It's very unlikely that you can't find what you want in the catalog, which is free. While I think the prices are not the best, the quality is. On that remark, they get an 8.

There is one place many of us don't even bother to look: the old junk box. The photo shows a 40-meter transceiver I built from two sources—Radio Shack and the junk box. It sports vfo frequency control and has an output of about 12 Watts. (If enough interest is expressed, I will print up the plans.)

Looks like I'm about to run out of space. In my next column I'll look at some more parts vendors and discuss how to buy parts and keep a good stock of the most needed QRP goodies.■

A QRP transceiver built with Radio Shack parts and a well-stocked junk box.

NK6K > PACKET

Number 22 on your Feedback card

Harold Price NK6K
1211 Ford Avenue
Redondo Beach CA 90278

Most of my previous packet columns have had some sort of theme, or at least they've been limited to one or two topics. This month, I'll dig into the bit bucket and pull out some short subjects, mostly in response to mail received here at NK6K.

First, the nocturnal habits of the West Coast *packeteerrius rattus*. I'm a late-to-bed, late-to-rise type. I roll out of bed around 9 a.m. and sack out around 2 a.m., after "Late Night with David Letterman." I also work at home. Therefore, people who call me on the phone at 6:30 a.m. West Coast time hoping to "get me before I go to work" usually don't get a coherent answer to whatever question they might have had. Note also that there is a three-hour difference between Redondo Beach and the East Coast, not two.

Since I don't have a "company phone" to use, all returned phone calls cost real money. I return far more than I should, but I'm trying to cut down. To get the fastest, most coherent response to a question, send it to NK6K-2 via the packet-forwarding system. Unless I'm out of town, this usually gets a same-day response. People not yet on packet are welcome to use paper mail, but that's too easy to stack up and hide away, so a fast answer via paper is unusual. An SASE is always appreciated.

Portable Packet

Chip McCoy WB9OZX wrote in to ask about the portable packet system pictured on page 30 of the August issue. His question is "What additional software is required to use the TRS-80 Model 100 as a packet terminal?" The answer is "none." The Model 100 has a built-in terminal program called TELCOM. Most of the other lap-top computers have a similar program. For the Model 100, start the TELCOM program and enter the following command: STAT 57I1E. Then say TERM. This should start you talking to the DB-25 serial port at 1200 baud.

Apple BBS

Jon WA2YVL asked about the N6BGW-9 BBS pictured in the August issue. He's looking for a W@RLI-forwarding compatible system that will run on the Apple. Scott Avent N6BGW is running a system that was originally developed by Lynn Taylor WB6UUT. Scott has since added a W@RLI-forwarding receive mode and is working on a forwarding transmit mode. Other than this system, I am unaware of any other W@RLI-compatible system for the Apple. If you have one, please write in and let me know. WA2YVL will be moving to South Freeport, Maine, soon, so look for his BBS up there.

France

Remy Jentges F6ABJ sent in a short report on packet in France. He's been involved in promoting the AX.25 standard and in getting about 250 TNCs up and running. He's also working on getting a WA7MBL system up on VHF. They will have had a packet general assembly meeting in October; packet is showing good growth in France.

Flip-Flop

Earl Morris N8ERO writes to say that he has added another bell and whistle to the add-on connect beepers available from several sources. He's added a flip-flop to the connect light so that the LED stays lit after a connection has finished. This lets him know if anyone has connected, left a message, and disconnected while he was out of the room. He's also added a switch to pull the DTR line on the TNC serial port to ground when he's not around. This forces the TNC to hold on to any data received. Some users have had trouble in the past when they simply turn off their terminal, since the DTR line might float and not inhibit characters from "falling on the floor."

N8ERO also notes that a TNC can be connected directly to a modem, giving packet users access to the phone network, and phone users access to packet. This is an interesting experiment and has some useful applications, but care should be taken when connecting amateur frequencies to a non-amateur medium. If the possibility exists that an unlicensed individual can gain access to an amateur transmitter, a non-automated control operator must be present. If you have implemented procedures, such as passwords, that ensure that the phone caller is licensed and is therefore able to operate your station as a control operator remotely via the phone line, you're in the clear. If you aren't sure of your security, it's best to disable that feature if you are not present and able to act as a control operator.

Note that once traffic that originated from a non-amateur has passed through that first non-automated control operator, it may be automatically repeated through the amateur digital network. This is discussed elsewhere in this column under the topic "Third-Party Traffic."

Newsletters

There are perhaps more packet radio newsletters in the land now than any other "specialty" group, and most other specialty newsletters and magazines include a packet column. This is because packet is still new and growing. If you've been on packet for a week you should have come to know more than 20 other new packeteers in your line of sight. Your local packet club and its newsletter can tell you more about how packet works in your area than a national magazine like this one can, so be sure to support your local group to get both parts of the story.

I'll continue to give you the big picture here. Several packet groups exchange newsletters; this is an excellent idea. I get a copy of several, and they're all very good. The only problem is a lack of steady input, which usually burns out the editor after a few months. I want to thank the crews at NAPRA's *Zero Retries*, the Packeteers of Long Island's *Poli Parrot*, and NEPRA's *PacketEar* for keeping me on the list.

Third-Party Traffic

I still get several queries a month on the topic of third-party traffic: "What is third party in relation to packet?" The most recent inquiry came from KM@M.

The best way to start the discussion is to look at the rule-making action in PR Docket 85-105. Also known as the automatic control docket, it gives complete and unambiguous permission to hams to run automated, unattended digital stations: when transmitting digital communications on frequencies above 50 MHz and while NOT sending third-party traffic.

As the result of several petitions for reconsideration and a petition for Extraordinary Relief filed by the ARRL, the FCC partially (and temporarily) waived the third-party provisions of PR 85-105. That waiver said in part:

"(a) The provisions of Section 97.80(b) and 97.114(b)(4) are waived to permit amateur stations, retransmitting digital packet radio communications (see Section 97.69) on frequencies 50 MHz and above, using the AX.25 (or compatible) protocol, to be operated under automatic control while retransmitting third-party traffic. See Section 97.3(v).

"(b) This waiver applies only to the retransmission of third-party traffic originated at another amateur station which is under local control or remote control. See Section 97.3(m)."

AX.25 is specified by name because it is the protocol in use by 99% or more of all U.S. hams and is therefore the most universally monitorable, and because each frame has a complete ASCII callsign identifying the sender. The FCC wanted to make sure that, during the period of the waiver, hams could continue to:

"...ensure that amateur facilities and frequencies are not used by non-amateurs. Only a person who has demonstrated the proper qualifications may be a control operator of an amateur station. Such control operators screen any third-party traffic to prevent transmissions which are prohibited by Subpart E of the Amateur Rules.... Those prohibitions include, but are not limited to, business communications, secret messages, radiocommunications for unlawful purposes, and radiocommunication with nations which have not assented to third-party traffic."

What does all this mean? Ignoring international traffic for the moment, my interpretation is that third-party traffic may be sent by an amateur station under digital control above 50 MHz as long as the traffic was originated at a station with a live non-automated control operator. Obviously, any BBS messages to be automatically forwarded or packets to be automatically digipeated that are originated by a ham are permitted. Any messages to be automatically forwarded or packets to be automatically digipeated that started from non-hams are permitted as long as a ham is present at the station at which the messages are put into the network. That means that a Red Cross worker can type mes-

sages into the keyboard of a packet terminal for transmission on the packet network as long as a ham is there to screen the messages. You may not turn your station over to that worker while you hike down to the food tent. You may, however, turn a computer over to a non-ham, who can then store messages on a disk while you are gone. When you return, you can screen the stored messages, and then dump them into a TNC.

The PR 85-105 docket, with waiver, is also clear about what you may not do. You may not:

- Run an unattended station below 50 MHz, no matter what the circumstances. It must have a control operator.
- Use the various digital rules and waivers above or below 50 MHz to send third-party traffic to foreign countries that do not permit such communications.

To summarize yet again and still ignoring international aspects:

1) Anything can be sent on packet above 50 MHz, automated or not, as long as a ham starts it into the network, either directly or as a control operator, and if that ham ensures compliance with all other Part 97 rules regarding permitted and prohibited communications, primarily no secrets and no business.

2) You can't run a digital HF station unattended, no matter what kind of traffic you're sending. Sorry, but those are the rules.

Note that whether or not the messages are third party have been factored out of the above, so we can ignore the question of what is third-party traffic. As long as a live ham is present at the starting point, the rest of the stations in the network can forward the message without reviewing it. The FCC asks that, for the period of the waiver, we carefully monitor packet transmissions and report any abuse of an automated station to the control operator so he can take proper corrective action.

Now for the hard part, international packet. If you don't leave messages for anyone outside of North America or to areas where we haven't signed a third-party agreement, you may skip to the end of this section. Otherwise, we must define third party. Looking at Part 97.3(v), we see:

"Third-party traffic. Amateur radio communications by or under the supervision of the control operator at an amateur radio station to another amateur radio station on behalf of anyone other than the control operator."

Let's look at an unambiguous case first: If NK6K is talking on 20 meters to G3YJO in England, that's legal. If an unlicensed friend of mine, standing in the room, wants to say "hello," that would be third party and not permitted. The friend's hello is not on my behalf, and therefore is not legal.

Now let's look at a tougher case. NK6K is talking to G3YJO through a satellite. At first glance, there are three parties involved, the control operator of NK6K, the control operator of G3YJO, and the control operator of the satellite. Fortunately, 97.417(c) exempts satellites from having control operators. In practice, amateur satellites are usually treated (when counting parties) as lumpy parts of the ionosphere. Therefore, the fact that you have relayed a message through a satellite does not make it "third party." A store-and-forward satellite would be treated in the same way.

Actual third-party traffic—e.g., if a friend wanted to say hello through my radio over the satellite—would still be illegal, unless a specific third-party agreement had been signed between the two countries involved.

We can define an even tougher case. Can a licensed ham send a message on VHF through several unattended digipeaters to a gateway, have it relayed via other VHF gateways to a satellite gateway, have it uplinked to a store-and-forward satellite, and then downlinked to a ham in a country that we don't have a third-party agreement with? Yes. The fact that it is going through a satellite can be ignored, since that does not turn traffic into third-party traffic. Going through automated digital stations does not make it third party. Thus ignoring the relay points, the question is then, is the communication on behalf of anyone other than the originating amateur station and the destination amateur station? In this example, it isn't, so it's OK.

There is one last case that is firmly in the middle of a gray area. What if, in the above example, one of the intermediate relay paths between the originator and the satellite gateway is on HF. Here we can't invoke the PR 85-105 waiver, since it doesn't apply below HF. All I can say is that since the message started with, and on behalf of, a licensed amateur, and it will end up with a licensed amateur, and the intermediate points are simply an automated extension of the ionosphere, it ought to be OK. It is certainly not OK if the communication is not on the behalf of the control operators at the end points when the countries at the end points haven't signed a third-party agreement. As long as we keep that in mind, we're OK.

Bunk

I've been hearing a lot of talk lately that Wayne doesn't realize the value of packet radio. Well, that's a lot of hooey. On Friday at the September ARRL National Convention in San Diego, the August "all packet" issue of *73* was selling as a back issue for $1. By Saturday, the August issue was selling as a current issue for $3. That should show those rumor mongers. I also understand that Wayne (or a reasonable cardboard facsimile thereof) spent the night enthroned in the DRONK hospitality suite, but I'm still waiting for photo proof on that one.

Kids

I'm short of space here, as always, but I wanted to mention something that happened last weekend at the ARRL National Convention in San Diego. A Youth Forum was held, chaired by astronaut Dr. Tony England W0ORE. I was one of the panelists. There were about 150 kids aged 9–15 in the audience. During my pitch, I asked the kids how many of them had a computer at home. Every hand went up. Later in the forum, a mother asked what it would cost to get involved in amateur radio. I then asked how many kids had a disk drive on their computer. Most of the hands went up. I pointed out that the cost of the cheapest TNC and a swap meet, special 2-meter radio is less than the cost of that disk drive. Not all potential young hams fall into this category, but a great many do.

Keep this in mind when pitching amateur radio to the younger crowd. Get a computer into the demo somewhere; it will be a good point of reference for them. Beware, though, one of the little rug rats is likely to tell you something you didn't know about your own computer.

Next month (maybe), the first ever *73* packet poll. See you then.■

UTILI-CASTING?

While some mergers result in funny names, the recent merger of **Monitoring Times** and **International Radio** (formerly the **Shortwave Guide**) has resulted in an excellent new 60-page magazine covering full-spectrum utilities communications as well as worldwide shortwave broadcasting activities. To keep it simple, we've retained the name of one of the two partner companies—**Monitoring Times**. It's all new, bigger, more colorful and more informative. Clearly, it's the most comprehensive publication for the radio listener available today! ✓71

Send for a free "sample digest" or subscribe by contacting:

CoCo BONANZA

I am a bit confused this month because the honorable editor of *73* pulled an editorial string and shifted some dates around. However, if I read things right, this should be published in November, so a Happy Thanksgiving to you all.

In the last column, I promised some goodies for the rather vocal CoCo crowd, and I shall not let you down. By now, I assume most of you have heard about the CoCo 3. Just being announced as this column is being written, the Tandy Color Computer 3 promises to present a serious challenge to many of the newer computers on the market.

A look at some of the listed features should be enough to boggle the mind. How about 640 x 192 pixel graphics in four colors, or 340 x 192 pixel graphics in 16 colors from a palette of 64; or RAM expandable from a supplied 128K up to 512K; or a built-in 80-character by 24-line display; or television (rf), composite video, and RGB monitor outputs; or even the ability to run OS-9 Level II? And all this for less than $240, according to my current sources! It sounds like quite a deal, and I for one can't wait to get my hands on one!

For those of us with current CoCos, however, the battle cry has been "give me a good RTTY program" for longer than I can remember. Well, folks, listen to this.

Ken E. Crowston VE5BBP, in Shellbrook, Saskatchewan, is the North American distributor for Grosvenor Software. This British line offers programs to put the Color Computer onto CW, RTTY, and AMTOR, and all for a rather modest price. Let me tell you a bit about the programs first.

The Morse program, BMKCW, functions as a full-service CW transceiver, kind of a glass Teletype™ for CW. The speed range, applicable to both sending and receiving, is from you've-got-to-be-kidding slow to about 200 wpm. Transmit speed is set up at the start and stays constant independent of received speed. Receive speed tracking is automatic and can be set to respond to machine or hand-sent code. A sidetone is even available to listen to through the television speaker to aid in tuning or monitoring. Want more? More than 20K of received data is stored and can be reviewed. Push-to-talk is directly controlled from the keyboard. A transmit type-ahead buffer is maintained, with editing of characters possible before transmission. And, not to forget, the ability to save and retrieve pages of text to and from disk.

No great surprise, the RTTY program, BMKRTTY, looks and feels very similar to its sibling program. This is, however, a very well put together program. RTTY may be received through an external terminal unit or with the computer directly doing the decoding of received audio. The computer is programmed to handle standard 170-Hz, 425-Hz, and 850-Hz shifts, without the need for an external demodulator. Murray baud rates of 45 (amateur standard 60 wpm), as well as 50, 75, and 100 are supported. ASCII data exchange is also supported at 110, 300, and 1200 baud. Some systems may even handle 2400 baud, they tell me.

The rest of the features are enough to make your head spin! A split-screen, type-ahead buffer supports some 4,000 characters in the transmit buffer. About 19K of data, close to an hour's worth of transmission, can be stored and saved to disk. Unshift on space, or not; automatic CR/LF at the end of a line, with programmable line length; even a receive "standby" mode, which monitors for a valid RTTY signal—kind of like autostart—are all provided. Oh, and let's not forget built-in RY tests, and QUICK BROWN FOX keys, as well as a 31-character scratchpad memory to enter the other guy's name and call into.

Both the CW and RTTY programs include identification keys, by the way, which transmit your call on CW, RTTY, or both on command. Your call comes pre-programmed when you buy the program, and can be changed only by the dealer upon a nominal payment with suitable documentation. This is a novel method of copy protection, in that you are free to make as many copies as you like, for your own use, but give one to a friend, and he is stuck with your ID!

The third member of this set is BMKAMTOR, an AMTOR transceive program for the Color Computer. By now, the features of this program should be fairly familiar. Split screen, user memories, disk save and recall, transmitter control, and other RTTY-like features are available. While this program does require a bit more hardware, including a 1-kHz external clock, the benefits to be gained are also a bit more. A 24-hour clock is displayed on the screen and is transmittable. Several modes of AMTOR transmission are supported, including FEC, ARQ, and listen to ARQ. And yes, CW identification is built in as well.

Now, as to the bottom line, I do hope you are sitting down for this. In Canadian dollars, the CW program sells for $28, the RTTY program for $28, and the AMTOR program for $45. Remember, these are Canadian dollars, so a conversion will be required to U.S. dollars, and the prices do not include postage and handling. So why not drop Ken a line, at Crowston Enterprises, 307-111 Wedge Road, Saskatoon, Saskatchewan S7L 6S8, Canada, and ask for a catalog and price list. RTTY software has been scarce, so let Ken hear from you, and tell him that you read about it here in RTTY Loop!

Galfo Update

One of the things that never ceases to amaze me is the ability of you readers to come forth with information to help others. In what may be a continuing saga of Apple communications, the tale of the Galfo program goes on. Jim Marold WB2TZK/7J1ABK/KA2JM/NNN0IFL writes with his story of Apple programs. He says:

"The Galfo program is actually called HAM.M communications disk. In addition to the RTTY/CW program capability, it has several other programs included. The main point is it runs in Integer Basic. The old Apple][ran Integer Basic as a matter of course, but the II+ requires Integer Basic be loaded into the language (16K expansion card in slot 0). If that's not available, there is an Applesoft program that emulates Integer Basic. Run that prior to running an Integer Basic program; as long as there is enough room in memory for both programs, you're up and running. The program was written by Dr. C. H. Galfo. There may also be a SSTV program on the disk.

"The program is certainly user friendly. On booting, it informs you of how much space is allocated to the receive and transmit buffers. This space can be shifted to put more in receive if desired. It then asks whether you want Morse, Baudot, or ASCII. If Baudot is selected, it then asks at what baud rate. The next question is word or character transmission, then the fill character (blank, LTRS, none). The program then goes into the receive mode with 2/3 of the screen for receive and 1/3 for transmit. There is a single status line with a tuning star. Calling various control keys allows putting either buffer on disk or getting a file from disk, changing speeds, changing modes, etc.

"The program handles machine CW very well compared to [another program I have used]. I monitor 10.415 MHz for Ursigrams (solar activity reports), which is machine-keyed at 20 wpm by JJD/JJD2 in Tokyo. The HAM.M program prints the CW as it's sent, and the wpm can vary without taking hits. If it drifts too far off, a simple Control-R puts it back on the chosen speed. The [other] program doesn't recognize the spaces in CW and runs everything together. When your data is five character number groups, reading [the other program's output] can get tedious. HAM.M looks at the game I/O port for a specific configuration. You must modify the software or your TU to match. [The other program] allows you to configure the software as part of the start-up procedure. Since I use a homemade TU, I had more problems getting [the other program] to look at the right pins than HAM.M."

I appreciate the information, Jim, and I am sure that the Apple users who frequent this corner of *73* second the thoughts.

Audience Participation

Have you noticed the "new look" of *73*? For those of you who may have just arrived, the changes are under the auspices of Wayne Green W2NSD/1, who founded this magazine and serves as a driving force behind the vanguard of amateur radio. Among all the things the new *73* gives you, it asks for only one thing in return. In each issue of *73* is a Feedback card. Tear it out, fill it out, and send it in. All it will cost you is a stamp. Tell Wayne what

you think of the various articles and columns (RTTY Loop is "Great," right?), add your comments, and send it in. The staff assures me that the cards are read and that their content does make a difference. And, you stand to win a year's worth of *73* if your card is pulled from the hat! Go ahead, do it now; I'll wait right here.

Are you back? Thanks. Now, remember that if you want to ask me a question, you can drop me a line at the address at the top of this column or send me E-mail on either CompuServe, using ppn 75036,2501, or Delphi, using username MARCWA3AJR. If you want a copy of the list of reprints or a personal answer in the mail, be sure to include a self-addressed, stamped envelope for Postal Service inquiries.

I have a stack of mail here to go through for next month. They tell me that contesting is the theme. Somehow that seems appropriate—because every month I have a contest, going through the mail you've sent me, attention RTTY Loop!■

ATV

Number 15 on your Feedback card

Mike Stone WBØQCD
PO Box H
Lowden IA 52255

ATV continues to fascinate many amateurs who have not yet experienced the thrill of being able to send their own video pictures. I've always been fascinated to be able to work ZS6BTD, ZS6AO, I3XQW, VO1BL, 8P6NC, ZL1BLV, HR2HH, FM7CD, ZL2FR, LU4EGO, OT6DI, OZ4IP, 5NØDOG, OH5RM, G3WW, and VP9IH on phone as well as SSTV. The nearby DX crowd around the 14.230-MHz SSTV operating frequency always manages to disrespectfully QRM SSTVers because they don't realize that SSTVers have the right to operate those shrilling tones anywhere in the phone bands. SSTVers purposely huddle together around one little area, though, for companionship and so as not to QRM others. It irritates DXers, I think, to have the SSTV crowd work rare ones right along with them on 15 and 20. On UHF FSTV hundreds of local amateurs are spellbound at ATV demos when they see the quality of full-color FSTV being sent on 420-440 MHz.

ATV seems to be the mode that is last on everyone's list of things to try out—but it is the most fun to operate. Why's that? I don't know. What could be simpler than a small UHF antenna, some coax, a tiny black box (downconverter), and a hookup to a TV set that probably is already in your shack. But if you just mention "TV" or "video," it scares the heck out of the people who think they have to be broadcast engineers to understand and operate the mode. Heck, I'm the editor/publisher of *The Spec-Com Journal* and I don't understand just how the video picture works. I know about lines and pixels and something called sync, but that's about it. Don't let the fact that you know nothing about ATV stop you from getting some gear and getting on. The mode needs your participation, and the work you put into it will be worth it because you'll gain a whole new bunch of friends.

Table 1. U.S. ATV Society state section manager volunteers. Please include an SASE when corresponding with these managers. Apply to WBØQCD for open positions.

FSTV Groups

One of the big problems in becoming active on FSTV is trying to find out where the nearby UHF operators are sending their pictures, what frequency they might be using on two meters, and what antenna polarization is being used. A lot of that work has been done for you. In 1983 the United States ATV Society was formed. The body was organized into 73 volunteer section manager positions. Although some positions are vacant, most states are well represented. Table 1 lists the USATVS managers. Feel free to contact your area's representative to help you get going on ATV (include an SASE if you write). If you're already active on FSTV, please update these volunteers as to the activity in your area.

Where Are They?

Metrovision (Washington DC area), formerly WR4AAG and now WA9GVK/R, has video out on 426.25. The local two-meter auxiliary audio frequency is 145.070 FM. Metrovision has over 40 ATV operators registered with the USATVS. In *Michigan*, WB8YOB has reported lots of activity. The Arrow repeater near Detroit is on temporary authority by the FCC to operate FSTV until the land-mobile business-band service gets going, but they are working on a 900-MHz system. KB8NR is active in the Flint area and is one of the original old-timers. W3SST reports good activity in the *York, Pennsylvania*, area not too far from the *BRATS* (Baltimore) ATV group. *St. Louis* ATV is alive and

well with WB0ZJP leading a group of ten or so UHFers. They monitor 144.430 FM locally. In the *Davenport, Iowa*, quad-cities area, about 30 FSTVers are on the air DXing simplex and working the fancy horizontally polarized 100-Watt N9CAI ATV/R. Most of the Midwest, including the *Chicago* area, uses 144.340 for a two-meter "talk" channel. The *Minneapolis/St. Paul* ATV group is led by WA9NJR on 147.57 and is full of activity. *California* uses 434.0, with 146.43 for two-meter audio; there are also several repeaters. Write to W6ORG for more information. There is a big ATV group in the *Phoenix* area called the "AAA5 Club" that is led by N7AOU. In the *Calgary, Alberta*, area, about ten ATVers are active (VE6AMU); there are about thirty near *Toronto*.

Photo A. 200-mile FSTV DX received by WB0ZJP in St. Louis.

Polarization

Antenna polarization is a nagging problem in some areas. Horizontal polarization is used for FSTV across most of the nation. This allows ATVers to also operate 432 SSB on the same antennas. Vertical polarization is used in California, Florida, Virginia, parts of Indiana (around Indianapolis), and parts of Texas. This allows 440–450 FM to be operated.

There are 60 plus ATV repeaters known to be operating in the country at last count (1982) and they are a mixed bag of polarization. It doesn't really matter which polarization mode is used in your area as long as you find out what the standard is and go with the crowd. Polarization has become quite a controversial subject among ATVers who like to DX. A number of horizontally polarized, omnidirectional antenna designs have been published, with a 7-dB K4NHN rib-caged modified Alford Slot having been successfully demonstrated this year at Dayton by the Cayce/Sumter/Columbia, South Carolina, ATV group.

Surveys show that the English-made Jaybeams and KLM beams are the most popular ATV antennas, followed by K2RIW's antennas and home-brew yagis. Good low-loss coax is very important on UHF frequencies, yet it is always the least-attended-to detail. A good rule of thumb is not to settle for anything less than Belden 8214 or Saxon 8285. Even with a 4.5-dB loss per 100 feet at 400 MHz, you will still lose nearly *half* of your power output and incoming receive on any long runs. The new Belden 9913 is now the hot buy for ATVers, with losses as low as hardline. Beware of 75-Ohm cable TV hardline. I know it is usually free, but you get what you pay for.

Preamps help amplify the received signal quite a bit. Some models can be switched out of line during transmit even at very high power levels. Advanced Receiver Research (Box 1242, Burlington CT 06013; (203)-582-9409) can provide you with some interesting brochures on preamplifiers if you ask for them. For more specific details on UHF antennas and coaxial cable, consult *Everything You Always Wanted To Know About ATV *but were afraid to ask* ($9.95, Spec-Com Publications, PO Box H, Lowden IA 52255).

SSTV Equipment

A few years ago, getting into SSTV meant spending nearly $1,000 to get the latest B/W scan converter, an audio cassette recorder, and a camera. Today you have a choice. You can still put out a lot of money and purchase the latest high-tech color SSTV equipment—Robot Research 1200C, $1,295, 256 pixels across the screen by 240 lines; high-resolution color makes for a beautiful 8-, 12-, 24-, 36-, or 72-second image picture; the unit does all sorts of tricks including automatic tracking and split-screening. (For a four-page color brochure on the system, send an SASE to Robot Research, Inc., 7591 Convoy Court, San Diego CA 92111.) Or you can look around for some older/used equipment, computer software, or interfaces.

Let's think cheap for a minute (not a big mental leap for most of us). Manufacturer-discontinued Robot 400 SSTV scan converters used to cost $795 new. They can still be found "new" at $395 on some dealers' shelves. Used converters can be found at most hamfests for as little as $150 if you barter a bit. These units are B/W, have a good picture resolution of 128 pixels per line by 128 lines, and will store one full picture in memory. (They can be converted to color with 400C board updates.) You simply hook a closed-circuit- (CCTV) or VCR-type camera to the FSTV input and it will convert the "live" picture into a slow-scan one. A simple connection to the audio input of your HF rig's microphone connector is all that is necessary for transmit interfacing. One audio wire runs from your speaker to the back of the Robot 400 for incoming signals.

Transmission picture rate is the former standard of 8 seconds per frame. Contrary to popular belief, there is still a lot of 8-second SSTV being sent. All modern day SSTVers have 8-second compatibility. All you have to do is explain the type of gear you are running and they will switch over to the faster speed format for you. During the Saturday SSTV nets, net controls try to always send an 8-second formatted picture for those still running that type of gear. There have been dozens of modifications to the Robot 400, and Ralph Wilson WB0ESF has compiled most of them into a thick booklet called *Robot Mods*. It is available for $11 ppd. from WB0ESF at 4011 Clearview Drive, Cedar Falls IA 50613.

If a Robot 400 is still a bit rich for your budget, then look for the older Robot 70 or SBE SSTV Converter gear. This equipment utilizes P7 image burn tubes of green or yellow and must be viewed in a dark corner to be seen correctly. Good pictures can be received and sent on this type of equipment, and the cost is usually under $100 for the whole outfit. Still too rich? How about a "reduced resolution" computer software program to receive and/or send SSTV. Radio Shack Color Computer owners have been watching SSTV pictures for years on a completely interfaceless (other than one audio wire from the receiver) 16K software program called "SLOWSCAN" from Kinney Software. This program has been modified to include just about all the current speed formats being used in SSTV, and it even receives and displays "false coloring." Dick Kinney W8MBD (121 Hampton Road, Donnellsville OH 45319) astounded the Dayton crowd this year with computerized SSTV for the Commodore 64. Unlike the CoCo program, which is receive only, SLOWSCAN III (C-64) receives and transmits by use of an owner-constructed interface card. Dick also has a video digitizer circuit and software that complements the program and construction kit. The C-64 software/kit packages sell for $39.95 each. There is also SSTV computer software for IBMs and Apples.

Clay Abrams K6AEP wrote a ton of software and interface designs for the CoCo for a number of years, but he gave it up when a small band of pirates tried to make some quick cash by selling his work. Clay moved on to the IBM computer, and he has once again developed some high-resolution SSTV and FAX software that will knock your socks off. Write Clay at 1758 Comstock Lane, San Diego CA 95129. Ralph Taggart WB8DQT even came out with a single-chip circuit called a ROM-SCANNER, which stores and sends SSTV pictures. If you missed out on the *Voyager* and space shuttle SSTV pictures from space a couple of years ago, Wayne Harrell WD4LYN (Route 1, Box 185, Sycamore GA 31790) now maintains a unique video and SSTV audio tape program collection and he will make quality duplications for a moderate price. Write him for a catalog.

You see, you can spend $39.95, a couple of hundred dollars, or up to $1,295 to get going on SSTV. The important thing is to get in there and get your feet wet with something.■

POLARIZATION

Actually, this all started out innocently enough . . . I was going to mow the lawn . . . really! It's just that every time I go outside to work, I always take a look up the tower and begin to think of new antenna arrays.

Photo A. The horizontal vs. vertical polarization test range. The 5/8-wave vertical is in the foreground and the KLM beam is in the background. Crescent, VHF/UHF's most famous dog, guards the test setup.

An incident that occurred earlier this summer came to mind: I had helped my uncle Ray Putman N2FYC install a new 17-element F9FT yagi at his home in Alexandria Bay, New York. After the job was completed, my wife and I proceeded to our summer home on Wolfe Island, Ontario, about 20 miles upriver near Kingston.

Ray and I initiated successful contacts on 146.550-MHz FM simplex; he was using his beam mounted horizontally on a 10-foot tower, while I employed an old reliable KLM 4-element yagi strapped to one of the roof studs with shock cords—also horizontally polarized. He used a Kenwood TR-7400A, while I was barefoot with an ICOM IC-2AT.

During the course of our first QSO, Ray asked what, if any, difference in signal strength would occur if he changed his antenna to a vertically polarized installation. I was in a position to do just that and within seconds unlashed the shock cords and rotated the KLM 90 degrees. Ray reported a drop of three "units" on the Kenwood scale! If the meter was accurate, these would be 3 S-units, worth about 6 dB apiece.

Of course, even not knowing what those "units" meant (if anything), it was pretty obvious to Ray that my signal had undergone substantial deterioration. And this brings me to why I didn't get the lawn mowed the other day . . .

One of the more common complaints I hear from newcomers to 2-meter SSB who previously operated 2m FM is that "there's no activity" or "I can't hear anyone" or even "all the signals are so weak. How do you make a reliable contact on SSB or CW?"

The problem becomes pretty obvious. In every case, the operators are still using the same old Cushcraft Ringo Ranger or Hustler vertical or KLM J-pole or even a vertically polarized yagi that was being used for FM work! It's not Murphy, but polarization losses that are doing them in—the same principles that allow satellites to transmit two different signals on the same channel by making sure they are polarized 90 degrees apart.

How much difference is there between signals received in the same plane as the receiving antenna and in opposite planes? Assuming ideal conditions with no scatter or reflection of signals, an infinite degree of isolation could be achieved between vertically polarized and horizontally polarized signals occupying the same channel. Since this isn't usually the case for the average ham, the number may be something finite and measurable.

In tests that I have run over the years, casual observation would indicate that as much as 20 dB or so difference is commonplace between stations with similar antennas 90 degrees apart from each other. How about that same operator mentioned earlier with a simple vertical trying to work a station with a simple yagi? To answer this question, I set up a test range in my backyard to see the results, using my KLM and a selection of vertical mobile antennas.

The first setup looked like this: An ICOM IC-2AT was attached through a Bird 43 with 5-Watt slug to a Larsen magnetic-mount antenna, using a 5/8" whip. The antenna rested on an aluminum plate to yield a ground plane. All of this rested on a garbage can atop a wooden stool. Photo A shows this elegant setup. About 40 feet away, I fastened the KLM beam to my tower about 6' above ground in a vertical plane (Photo B). The output from the beam was fed to a Boonton Electronics Model 92 rf millivoltmeter with 50-0hm terminated probe (Photo C).

I used the wattmeter solely to establish the presence of a stable signal from the 2AT. After keying the hand-held with a switch into transmit, I logged the readings from the millivoltmeter. The reading was +2 dBm with the hand-held running 1 Watt output. Next, I turned the KLM 90 degrees and remounted the clamps (Photo D). After careful aiming and peaking, I logged a reading of −17 dBm, a net loss of 15 dBm of signal—over 2 S-units. Pretty substantial!

Next, I switched to a quarter-wave Larsen radiator (Photo E). With both antennas in the vertical mode and running 1 Watt output, I logged a reading of −1 dBm on the meter. Rotating the KLM beam horizontally then resulted in a reading of −14 dBm, a net loss of 13 dBm of signal. (Incidentally, this test also showed, in a crude fashion, that the 5/8-wave antenna exhibited gain of about 3 dB over the quarter wave.)

What if I used an improper radiator? A 220-MHz quarter-wave radiator—not resonant at 2 meters—was connected. In the vertical mode, I noted a reading of −7 dBm. When the KLM was rotated

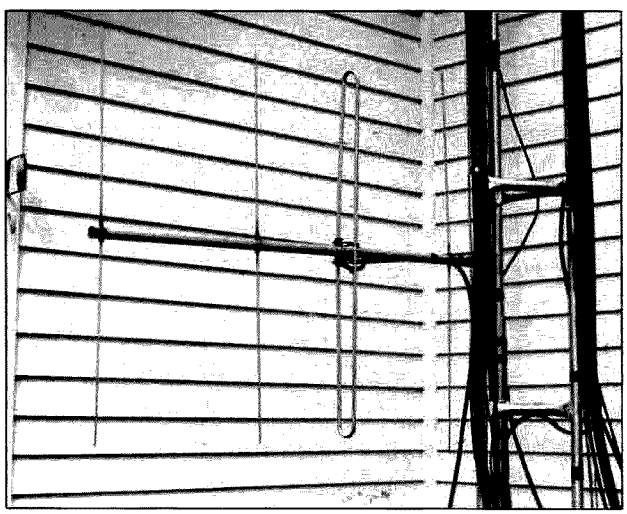

Photo B. The four-element KLM beam is connected to the tower and is vertically polarized. Output from the KLM beam is fed to an rf millivoltmeter.

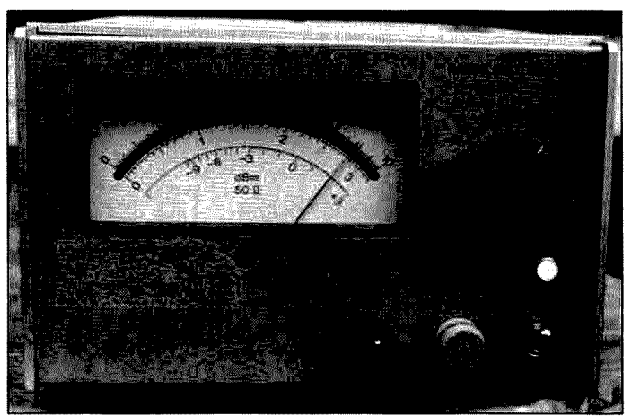

Photo C. Rf millivoltmeter measuring output from the 5/8-wave Larsen antenna in a vertical plane.

90 degrees, the reading changed to −23 dBm, a loss of 16 dBm . . . almost 3 S-units. There was a pattern of sorts here. Note that I expected and noticed substantial reflection from objects around the KLM beam (including myself), much as might happen in the average amateur installation.

All right, let's put two and two together! Fact #1: SSB and CW modes aren't called "weak-signal modes" for nothing. Most of the signals you will encounter in this operation are many miles distant, using moderate- to high-gain yagis and 99% are horizontally polarized. Fact #2: When operating these modes, you'll often find an average signal level of S3 to S6 to be quite common. Conclusion: It's hard enough work to copy a station running S2 to S3 out of the noise while on SSB or CW. It's pretty well impossible to copy a station in the noise! Lose 12 to 18 dBm of that weak signal due to polarization losses, and you've lost the battle before it's begun.

The moral? If you plan to try some SSB or CW work on 2 meters, give it an honest shot and use a horizontally polarized yagi with some gain. Take that same weak signal, and you'll pull it right up out of the noise to Q5 copy with a 10 to 14 dB gain yagi.

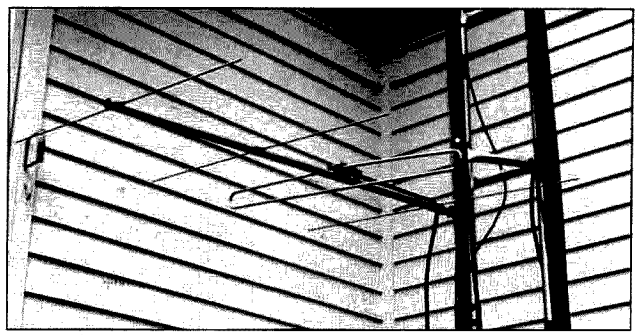

Photo D. The KLM beam in a horizontal plane.

Photo E. The test rf source, an IC-2AT, feeds a Larsen quarter-wave antenna. A Bird 43 monitors steady output.

Feature Dept.

I haven't featured anyone lately here, but a recent purchase brought a supplier to my attention that may help you as well. Kentronics, located in New Jersey, is a surplus test equipment store with a huge stock of goodies. The proprietor, Brian Kent, was helpful in locating a 50-Ohm BNC coupling for the previously mentioned Boonton rf millivoltmeter, allowing me to take signal measurements directly from antennas. He has a nice selection of used scopes, signal generators, and other test-bench material in good condition. Brian is located at PO Box 2444, Allaire Airport, Farmingdale NJ 07727, and his phone number is (201)-681-3229. Brian travels to many of the major hamfests (including Dayton). Just look for the fellow with the cigar amidst Tektronics scopes. Maybe he can help you as well.

Mailbag

Ron Manfredi WA2EIO of Merrick, New York, inquires about antenna changeover relays. Boy, have they gotten out of hand! Dow-Key division of Kilovac Corporation in California, makers of the familiar Dow-Key antenna relays for HF operation, also manufactures a line of relays for high-power VHF and UHF operation. Hold your breath, though; they will set you back about $200 for DPST types and $180 for SPDT types. A better way might be to consider plowing through flea markets for used units (they *do* surface from time to time). EME Electronics of West Germany makes an excellent UHF-type relay with N connectors. It's good for 1,500 Watts at 144 and 220 MHz, and in excess of 1,000 Watts at 432 MHz.

Coil voltage is 12 V dc, and the units are available in SPDT configuration with and without external contacts. Prices range from $115 to $130, depending on contact arrangement. Contact the U.S. importer (The PX Shack, 52 Stonewyck Drive, Belle Mead NJ 08502) for further details.

Arturo Nelson XE1FV writes from Guadalajara, Mexico, to ask why I didn't include the Yaesu 726R in my comparative review of the ICOM IC-471A and Kenwood TS-811A (June, 1986). The answer is easy: I couldn't locate one from an area ham at the time! These units were not purchased for the test, nor did they come from the manufacturers for evaluation. I simply located two local amateurs with the units who agreed to lend them to me for the comparison. This way, I'd be sure to get something off the shelf without paying for it (cheep! cheap!). I am aware that the 726R is a very popular unit, and I do plan to obtain one shortly for evaluation. Then I'll plug the numbers into the comparison chart to see how it stacks up against the other two contenders.

Arturo uses his for OSCAR operation primarily, although he's in the process of putting up antennas for weak-signal DX operation on 144 and 432 MHz. A harsh noise environment has prompted his construction of stub and cavity filters for 144 MHz (welcome to the club, Arturo!). This is probably one of the more infuriating things you can encounter as an active VHFer. I know, because I fight it every winter, usually during the January VHF Sweepstakes! This is why I've gone to an ICOM 740S with transverter for the bulk of my 2-meter contest activity, since the 740 has an outstanding variable noise blanker. Between precipitation static and space heaters, it's a running battle to keep the QSO rate up. I'm not surprised that the noise blanker is inadequate in the FT-726R as Arturo reports—very few of the Japanese VHF multimodes have a decent noise blanker. The problem is that using one fixed setting for various types of noise won't work. ■

AERO MEXICO CRASH

ARES preparedness in Orange County, California, was put to a test on Sunday, August 31. An Aero Mexico DC-9 jet on approach to Los Angeles International Airport collided with a single-engine Piper aircraft in the skies over Buena Park, a Los Angeles suburb. Both aircraft plummeted to the ground in the adjacent city of Cerritos. The DC-9 fell into a housing development, while the smaller aircraft crashed into a nearby schoolyard. All passengers and crew on the Aero Mexico jet and the three people in the Piper were killed. More people died as burning debris from the DC-9 destroyed 17 homes.

Amateur radio's involvement began when an official alert was called, activating the Orange County Red Cross and the Orange County Amateur Radio Emergency Service. ARES was to provide primary communications for Red Cross relief efforts. Using the facilities of the N6ME repeater on 145.40 MHz, the Red Cross Santa Ana Chapter amateur station WB6QDG was activated and it soon became the hub of Red Cross relief activities. Amateurs equipped with two-meter mobile and hand-held gear were dispatched by radio to the disaster site to coordinate communications for Red Cross operations. They also aided the communications of other disaster agencies. The operators performed like a well-oiled machine, proving again the value of regular emergency drill sessions. It appears as if two dozen or more Orange County ARES members were called into service before net management was transferred to the Long Beach Red Cross chapter office. Ancillary communications used the facilities of the KC6K 146.97 repeater in nearby Anaheim.

About an hour after activation, Net Control WB6QDG put out a call for mobile and portable packet stations. They were desperately needed at the crash site to handle high volume written traffic. With none initially available in the immediate area, hams from further away offered their services. One was a mobile packet station in a recreational vehicle in Riverside some 75 miles from the crash. The other was an operator with a battery-powered portapacket system in Pasadena. One was ordered to the Santa Ana Red Cross chapter building and the other to the disaster site. As word of the disaster filtered down to the digital community, local packet stations joined the traffic net. One of the few problems noted was that poor communications exist between the digital and analog factions of the local amateur community. We were told that most digital enthusiasts spend little or no time monitoring local voice communication. Several people have already told *Westlink* that this situation will quickly be corrected.

Even in a time of disaster, the southern California kook corps had to come out of their ratholes and add to the grief. During the emergency communications on the N6ME repeater, there were several incidents of malicious interference. The net control and the operators ignored the jamming and most of the interference disappeared after what appeared to be T-Hunt teams gave the names and callsigns of the alleged jammers over the air. Maybe this is the only way to handle the spoilers.

Analysis

I first heard about the mid-air collision from Joe Merdler N6AHU. A quick call to the newsroom of the television station where I work confirmed that the accident had taken place, and I quickly tuned to CNN Headline News to see if they had any further word. Nothing there, but KCBS had interrupted normal programming and already had live pictures from the crash scene. Almost immediately I saw a ham talking into an FT-208R. Ham radio was on the scene as a part of the rescue and relief effort.

ARRL Division Director Fried Heyn WA6WZO has spent a lot of time in building up a functional ARES operation in the Orange County area. Fried had started the job long before he was elected a League Director. The Orange County group has their operation down to an exact science. A few phone calls confirmed that it was Orange County ARES that had been activated to provide ancillary communications to the Red Cross. I learned the frequencies in use from April Moell WA6OPS. Being separated from the activity by a pair of mountain ranges, I plugged the numbers of the N6ME system into a private UHF remote base and began to listen and record.

What I heard made me proud to be a ham. The hams aiding the Red Cross relief operation utilized a minimum amount of talk to transfer a maximum amount of vital information. You could tell that the operators had spent their drill hours wisely. Their performance was all but flawless, proving once again the value of regular training exercises. However, this tragedy did point up two important negatives that require discussion.

Problem 1

The first problem was obtaining packet stations locally for dispatch to the disaster area and the relief coordination sites. As those of you who read last August's issue of *73* are aware, a vast network of packet operation has its own hub in the Los Angeles/Orange County area. In fact, packet is the fastest growing mode of amateur communication in California. There are thousands of packeteers already on the air, and hundreds of new stations are coming to the mode every week. So why, with all of this activity, should there be any problem in obtaining operators and gear?

The answer can be summed up in one word: specialization. As explained to me by fellow *73* columnist Harold Price NK6K, the "digital folks" and the "analog folks" have no common meeting ground. That is, the digital community spends little if any time monitoring any local voice communications, and voice-only operators who have no packet gear have no way to communicate with the digital-only groups. You can see why a problem with obtaining instant portable and mobile packet stations might arise. Harold feels that this problem can easily be overcome with a simple exchange of phone numbers, but I feel it has to go a lot further than that.

If packet radio is as important in emergency service work as it appears, then it is a must that all ARES groups have all their members packet-equipped—or if this is not economically feasible they should develop a second, parallel "Digital ARES Network" by either absorbing or utilizing the services of an existing packet group. This means that an NCS or other individual in a position of responsibility must be equipped with both digital and analog gear, and have the ability to operate both simultaneously or through a second, parallel NCS.

The overwhelming need for packet in the aftermath of this disaster is definitely an indicator of things to come, and while packet will never completely replace voice, the latter may soon become subservient to the former in situations where a high volume of written traffic takes place. The only variable is the human typing the traffic into the terminal or the computer.

Even though I am not yet active on packet, I am convinced that it will become the backbone of local, regional, national, and international traffic interchange within only a few short years. The digital transponder on board the new Japanese amateur satellite, Fuji (which the AMSAT folks call Japan OSCAR 12), is only a sample of what's to come. I am willing to say that packet will be the key that fits the coffin marked "Morse code." Packet will lock and eventually bury that box forever.

Red Cross and RACES take note. Packet is not the "wave of the future." Rather, it's the "wave of the present," and it's the most logical answer to your high-volume written communications needs. If you are not equipped with it, it's time to get your act in gear. If you have been awaiting proof of need, that proof is now here. An emergency phone-up list of available local packeteers can only be a temporary expedient. For packet to become a fully functional part of emergency communications, its operators must involve themselves in ongoing weekly training exercises, and an integrated radio call-up system must be developed that alerts the digital folks of a communications need at the same time that it gives this alert to the voice communications people.

Problem 2

Now to the other problem noted during this emergency: wanton and malicious interference to communications on the N6ME repeater during the emergency relief effort. You would think that in as tragic a situation as this even the worst of the nut cases would

have some respect for the dead and dying. Well, in an area where jammers consider themselves to be an elite corps, and where everything has been tried—including prison terms—to end jamming with only a modicum of success, what can you expect. I have long maintained that the real key to ending the problem is to never permit "a certain amount of jamming" to become the accepted norm. Well, in the Los Angeles area, accepting a certain amount of jamming appears to have become an acceptable standard of operation on the two-meter band, and it's the main reason that I spend very little of my time in Los Angeles on two meters. On the other VHF and UHF bands, no level of malicious interference is tolerated, and the rumor mills run rampant with stories of why "this jammer or that is now hospitalized." In fact, it's rather reminiscent of two-meter FM in New York City in the late 1960s. For the pacifists out there, I am not condoning violence. In fact, I cannot even say for certain that it has taken place. Maybe it's just all rumor and innuendo started to keep the fanatic fringe in its place. Whatever it is, it works.

But that's 220, 450, and other bands, not two-meter FM in Los Angeles. So, it was almost with amazement that I heard a transmission similar to this: "This is W6XXX mobile. I'm parked outside the home of NX6XXX and he is jamming the emergency communications." A definite statement of fact from a member of a T-Hunt team. Not one of those "I think it's NX6XXX" type transmissions from a base station 30 miles away. And the result? Silence from the jamming station. I can only hope that what this is really saying is: "We in southern California have had it with you jammers, and we are just not going to take it anymore! See you in court, jammer." It's about time.

"Even in a time of disaster, the southern California kook corps had to come out of their rathoies and add to the grief."

Fuji

There is a rather interesting aside happening between AMSAT and the Japan Amateur Radio League. It's not a knockdown, drag-out fight, but nevertheless it's taking place and it's over the name of the newest amateur satellite. Before its successful launch in August, we all knew the bird by the same name. It was called JAS-1. Some places wrote the name as "Jazz-One," but at least everyone was content with the one name. On August 12, that all changed. From JARL HQ in Tokyo I received the following telex message: "The H-1 rocket carrying the first Japanese Amateur Satellite JAS-1 has successfully lifted off at 20:45 UTC 12 August 1986 from the Tanegashima Space Flight Center." A few hours and several telex messages later, the following confirmation of success reached the *Westlink* newsroom, reading in part: ". . . new born satellite JAS-1 was named 'Fuji' by JARL today. Please call it 'Fuji' from now on. . . Shozo Hara, President - JARL."

That seemed simple enough. The JARL and its associated organizations designed, built, and orbited the bird, so as far as I was concerned it was theirs to name as they pleased. Why should anyone want to interfere? I really don't know the answer, but you might want to ask AMSAT since they insist on calling Fuji "Japan OSCAR 12," or more simply "JO-12." This apparently upset the Japanese more than a bit, and probably accounted for the delayed but emphatic follow-up telex bearing the Fuji designation.

Anyhow, the AMSAT folks appear to be adamant that they will be the ones giving Fuji its name, and as of September 1, 1986, the name that AMSAT is sticking with is JO-12. AMSAT's *Amateur Satellite Report* of this date fails to take note of the JARL preference for the Fuji designation. Who will eventually win this low-key international battle of the satellite name? In this case, I'll put my money on the Japanese. After all, it is their satellite, and they should be permitted to call it anything that they want. Who knows, maybe by the time you read this the satellite will have a single and accepted moniker.■

Tired of listening to all the chatter on your favorite VHF/UHF repeater while waiting for that important call?

Auto-Kall
AK-10

You don't have to anymore with the **Auto-Kall, AK-10,** a ready-to-use DTMF (Touch-Tone*) selective calling system. All you add is the radio!

FEATURES:

- ★ Completely assembled and ready to use. Simply connect to external speaker jack on your rig. Audio mini-plug patch-cord included.
- ★ Easy setting of your personal 3-digit code in seconds with small rotary switches. No jumpers to solder.
- ★ 8-15 VDC for mobile/portable operation or use supplied 117 VAC power supply for base station operation.
- ★ Built-in 8-OHM speaker turns on when your code is received to let you hear the station calling.
- ★ Resets automatically to silent-standby and leaves red LED on to let you know someone called if you were away from the rig.
- ★ CMOS circuitry provides for low current operation.
- ★ Measures only 1¼ x 3 x 5½ inches.

Only $79.95 (Plus $3.00 Shipping/Handling)

73 INTERNATIONAL

Number 27 on your Feedback card

NOTES FROM FN42

Zambia has joined us this month and 73 International now covers the world from A to Z! Now how about the only four (possible) missing letters in between: O, Q, W, and Y? The three can be only Oman, Qatar, and Western Samoa (an independent state) but either the Yemen Arab Republic (North Yemen) or Yugoslavia would cover the last. We are waiting. . . .

BRITISH WEST INDIES

Roger A. Corbin ZF1RC
Secretary Cayman Amateur Radio Society
PO Box 1549
Grand Cayman
British West Indies

Have you been wondering why you did not receive a OSL card from your contact with a station using a ZF call? Here's the explanation, and some additional information from a lovely spot in the Caribbean Sea.

ZF2 callsigns may be used only when an operator is in the Cayman Islands. An operator who signs /ZF2, portable ZF2, or ZF2 maritime mobile is operating illegally and QSL cards received by the bureau operated by this club for stations using the above calls will be destroyed.

A year ago this month (November) a station using ZF1RC with an operator calling himself Ron was operating illegally, and a number of amateurs seeking QSL cards now cannot be served. To compound the confusion, that was the call assigned to me a month later, on December 21, 1985.

The Cayman Islands do have reciprocal licencing agreements with a number of countries, including the United States, but sometimes we get left off the lists. It may appear to many amateurs that it takes a very long time to get a response to QSL cards sent through the local bureau. This is due mainly to the fact that most of the ZF2 operators visiting our country forget to make arrangements for cards to be forwarded. We are taking steps to try to correct this situation. This club now operates an open repeater on 146.76 with a 600-kHz negative input frequency. The simplex frequency most regularly used locally is 146.52 MHz. 73, ZF1RC.

CANADA

Dean Milner VE1CBF
28 Castle Drive
Sydney, Nova Scotia B1S 2A2
Canada

Canada returns to 73 International after an absence of nearly three years. . . but was well-represented during that period in other parts of the magazine. Our new correspondent, VE1CBF, would like to know what readers would like to hear about. Let us know here at 73 (mark for "International Editor") or, if you write him directly, send us a copy of your letter so that we can know, too! Time and space constraints for this issue made it necessary to pass on only the following from his first report.

The Canada Day Contest in July showed again a noticeable increase in participation of amateurs from outside Canada, some seeking points toward the Canadaward. The next Canada Contest will be, as usual, on the last weekend in December. For a copy of the rules and/or more info on the Canadaward, write the Canadian Amateur Radio Federation (CARF), PO Box 356, Kingston, Ontario, K7L 4W2, Canada.

The fight continues in the case of Jack Ravenscroft VE3SR, off the air per a court injunction "as he was creating a nuisance. . . by interference to electronic appliances" in a neighbor's home. An appeal has been filed against the liability finding and damages awarded, and the case is being followed closely by the Department of Communications and all rf spectrum users. Jack's legal expenses currently stand in excess of $15,000, and he is grateful to amateurs from other countries who have made contributions to the Jack Ravenscroft Susceptibility Defense Fund (PO Box 8873, Ottawa, Ontario, K1G 3J2, Canada) to help him out. He also is grateful for the moral support he has received through letters.

CUBA

Eduardo Fernandez Rodriguez
Presidente, Federacion de Radioaficionados de Cuba
Apartado Postal No. 1
Habana 1
Cuba

We welcome Cuba to 73 International; Rafael Fernandez CQ2RX will be our correspondent. Sr. Fernandez is the FRC officer responsible for liaison with the IARU and knows a lot of amateurs who can supply him with items for this column.

We have the Cuba DX Group (G.DX.C.) created about one half year ago which has about 55 hams. We have a certificate for those who establish two-way contacts with four members of the group. The FRC invites you to join the Group for life membership. For 30 IRCs or US$10 we will send you a membership certificate, decals from the G.DX.C. and FRC, a G.DX.C. pennant, an FRC pennant (all these in full color), a personal unit number, postcards and stamps of Cuba, and a roster of members. Your station will count 1 point for the G.DX.C. Award.

With your application (send to the above address) let us have your full name and address, DXCC countries confirmed, itemized list of your equipment and antennas in use, bands and modes you operate, languages you speak, and let us know: Do you QSL? Have you been on any DXpeditions as an operator? Do you have any of the following awards: DXCC, WAS, WAC, WAP, WPX, WAE, AAA, ADXA, DUF, BERTA, Cuba, G.DX.C., Caribe and/or America (see some of these described below)?

Concerning visitors, we have had Canadian, German, Spanish, and Bulgarian hams who have operated our club equipment and made many contacts. If anyone wants to visit and operate, we recommend you let us know two or three months in advance to make the necessary coordination with the Frequency Management Authority in order to get a provisional license—or you could write direct to: El Director, Direccion de Frecuencias Radioelectricas, Ministerio de Communicaciones, Plaza de la Revolucion, Habana 6, Cuba.

Concerning the growing of amateur radio in our country, it is going on. For instance, in 1981 we had 315 members in our Federation who were licensed to transmit and in 1986 we have 730 members with 464 licensed to transmit, and we have 534 licensed stations, 18 of which are club stations.

We have a QSL Bureau, of course; it is at the FRC address.

Cuban prefixes are CM for second class stations or Novices and CO for first class stations and Juniors. CL and T4 are for special events only.

South of Cuba is a key called Cayo Largo which is a wonderful place for DXpeditions, tourists, and rest, for which a visa is not needed—it is possible to arrive there direct by plane or ship. I would be happy to provide additional information if you would like.

[*Editor's Note: Remember always to send IRCs with letters you write as a result of information you read in these columns, when you are asking for replies.*]

AWARDS

For OMs and SWLs, SSB, CW, 1 band or 5 bands, do not send QSLs but only list of contacts including date, time, band and mode (certified by your radio club or two licensed hams), with 10 IRCs or US$2 per award; mail to Award Department, G.DX.C. at above FRC address: Cuba Award.Work (hear) the eight districts of Cuba (CM1–8, CO1–8); up to three missed districts may be substituted for with radio club stations. Use three suffix letters. America Award. Work (hear) countries and islands in America. Class III (category C) 30 countries and islands; Class II (category B) 40; and Class I (category A-Excellent) over 40. G.DX.C. Award. Work (hear) four members of the Group, any nationality. Identify with QSLs. For the Caribe Award, any mode, any band, work (hear) countries and islands in the Caribbean, including XE, VP1, TG, HR, YN, TI, HP, HK, and YV. Class III (C) 20–24 countries and islands; Class II (B) 25–29; and Class I (A-Exc.) 30 and over.

CYPRUS

Aris Kaponides 5B4JE
PO Box 1723
Limassol
Cyprus

Cyprus on paper seems to have a very large number of amateurs compared to its population. There are nearly 500 licenses to a population of about 650,000, but unfortunately the really active amateurs on the HF bands are not more than a dozen. Most amateurs are on VHF or they gave up the hobby, changing to another one. There is, however, an encouraging factor. During the last radio amateur examinations quite a few young people got callsigns. Some of them are harmonics of old amateurs, one of them being my second harmonic, John 5B4TZ, who is going to operate on HF regularly.

Catching you up with news of Cyprus: In 1985 was the 25th anniversary of the Cyprus Republic, and Cyprus amateurs were given the special prefix of 5B25 for use between August 17th and December 31st. This gave the chance for many amateurs to work this prefix and the 5B4 activity was increased at the same time. Unfortunately no award was programmed for the occasion, but the old Cyprus Award is still available.

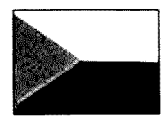
Some of the specialized modes have started to be in use by Cyprus hams. On RTTY-Baudot we have (5B4)OK, OA, OP, NA, NG, IT, MC, and MD in Nicosia, JE, OV, and CV in Limassol, and CR in Larnaca City. On AMTOR, we have in Nicosia MD, OA, OK, FN, and IT. They are still experimenting and also use auto-AMTOR.

The master of satellite communications is undoubtedly Akis 5B4OA, who is QRV regularly on OSCAR-10. Others active on satellites are Spyros 5B4MF and Andreas 5B4LP, who operate from their school club station, 5B4ES.

On SSTV we have Nicos 5B4CV as our number one, and (5B4) HF, OA, MD, and OK.

On the VHF scene we have Andreas 5B4LP, who is the only one operating meteor scatter, and in 1985 he had fine contacts with UB5 and 9H1. On sporadic E, 5B4 hams had successes with LZ, YU, SP, HG, UB5, and I. During the recent June sporadic E opening, Nick 5B4AZ, using only a handheld and 1/4-wave telescopic whip on his FT-290, worked about ten stations from Italy.

Peter G4UIK operating from 5B4JE's shack as G4UIK/5B4.



On tropo during the summer, contacts are quite easy between 5B4 and all the neighboring Middle East countries. All Israeli repeaters can be accessed and also the Amman repeater in Jordan sometimes. Simplex QSOs are also made with OD, 4X, JY, SU, SV5, and SV9 lands.

Although contesting in Cyprus is not so popular with the majority of amateurs, regular participants in various contests include 5B4MF, 5B4LP, 5B4DN, 5B4NC, and 5B4ES. Their results were very good, and at the last annual General Meeting of the Cyprus Amateur Radio Society, Spyros 5B4MF and Andreas 5B4LP were awarded honorary plaques in recognition of their activity and promotion of the hobby.

During the past few months many foreign amateurs have visited the Island and met many local amateurs. Mike A71AD came in May and has now settled in Nicosia, operating with the call 5B4TI. Also visiting Nicosia, SV5RW and OH8MA. In my own shack this summer, I had Jim GM4HKW, Peter G4UIK, Rudi DJ0MAF,Alecos SV2QO, Peter OH1RY, and Amir 4X6TT. It is always a pleasure to meet hams from other countries, and if anyone is visiting Cyprus, do not hesitate to contact 5B4 hams.

ZC4 activity is regular, especially on CW. From Akrotiri base, the most active is Adrian ZC4AP, and from the Dhekelia base, ZC4MR and ZC4EE. In the very near future the Episcopi club station, ZC4EPI, will be operational, and the secretary, ZC4DA, informed me that 5B4 amateurs of the Limassol Group will be allowed to operate from their club station as associate members. So I hope that I will be operating myself from there as ZC4EPI and enjoy the pileup.

Last item is the announcement of the operation of a new club station in Limassol, 5B4BBC. It was founded by the ham employees of the BBC relay station in Cyprus, and its first president is Andy Matheson 5B4DN, who also is ZC4AM.

CZECHOSLOVAKIA

Rudolf Karaba (OK3KFO ARC)
Gogol'ova 1882 955 01
Topol'cany
Czechoslovakia

As this is being written, all four semifinalists in the U.S. Open Tennis Tournament are Czechoslovakian. It seems safe to predict that the men's and women's champions will be Czechoslovakian! Congratulations, Czechoslovakia!

Czechoslovak radio hams sincerely invite American hams to take part in our OK-DX Contest;

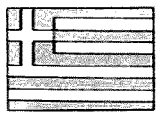
Ferdo OK3CXW DXing on 80-meter SSB.

the general level of the contest will be raised by your participation. It is scheduled for November 8–9, Saturday and Sunday, 12 o'clock to 12 o'clock UTC (being the usual 2nd November weekend). 1.8–28 MHz on CW/SSB. Contacts OK on same band for CW and SSB. CW: on 20 and 80, use the 3.500–3.560 and 14.000–14.060 windows for CW; SSB on all frequencies. Band changes only after a 10-minute minimum on one band.

Three points for contacts with OK and OK4/MM stations, one point for other contacts (except no points within your own country). Multipliers are zones according to the ITU list, on each band separately. Total score: all contact points times all multipliers. Categories: single operator, single band; single operator, all bands; multi-operator, multi-bands.

Send logs in usual way, reports and ITU zone, before the end of November, to Central Radiociub, PO Box 68, 113 27 Praha 1, Czechoslovakia.

EL SALVADOR



Marco A. Orellana YS1OD
PO Box 464
Calle Progreso 3332
San Salvador
El Salvador

Welcome to YS1OD! More from him in the future, but in the meanwhile he wants us to know. . .

I'll be glad to be [the El Salvador correspondent] and help any ham who has interest in visiting El Salvador for a short, medium, or a long period, as visitor or temporary resident. In case some DXpedition wants to operate from this country, I will like to have all the information at least 60 days in advance in order to do all the paperwork for the government and also to get prepared to welcome them.

We have two QSL Bureaus: Radio Club YSDX, PO Box 05–43, Metrocenter, San Salvador, El Salvador, and CRAS QSL Bureau, PO Box 517, San Salvador, El Salvador.

If any ham needs information about how he can operate here, he can contact me at the above address; telephones: direct international dialing: (503) 23–8183 or (503) 24–3954.

GREECE

Manos Darkadakis SV1IW
Box 23051
Athens 11210
Greece

In my column last January, I have told you of some of the problems we often have with illegal operations from Mt. Athos. Now I am going to tell the legend of Mr. Frank Turek DL7FT and his efforts to put this rare country on the air.

This year, as in 1985, he wasn't even inside Mt. Athos territory but operated from somewhere outside, as usual. Of course he says always that he was inside and that he had a license for that and all those good things to hear, but the truth is rather different. He never had and never will have a license other than the "Diamoneterion" (staying permit) which says one may visit and be in the monasteries for religious purposes only—and he may not even have had that since you don't need it if you never go inside Mt. Athos.

Last year we made a protest to the German PTT. This year we are going to have reciprocal agreements between West Germany and Greece reconsidered.

We remind you that the law covering amateur radio operation in our country for Greeks and foreigners clearly states: in order to get permission for amateur radio transmissions from the Holy Mountain, the applicant needs a written permit from the Holy Community of Mt. Athos as well. (From Legislative Decree 271 of 30/April/76—Official Gazette 102/B.) Furthermore, we strongly believe that certain rules have to be obeyed when somebody is participating in the DXCC Award (paragraph 12 covering operating ethics).

Mr. Turek went also a little bit further this year. He tried to throw mud on our operation back in 1980 (SV1DC/SV1IW/SV1JG), saying he had proof that we were operating from a hotel . . . but he didn't care! (What a big heart he has!) The least we can do is to show our pictures: one of the "the hotel" with the 12AVQ on top of it, and one of SV1DC's head popping up through "the hotel's" roof!

The story goes on with DL7FT in SV5 for a new expedition from May 3 to 25. He announced it as mostly to give a new one to the Japanese. He also promises to go again to Mt. Athos after SV5 in order to take care of those unlucky ones who missed him the first time.

On the other hand, the RAAG (the Greek association) received a letter from our PTT stating that the license of Mr. Turek has been revoked as of April 24, 1986 (see Fig. 1). The reasons are clearly stated. The police then began looking for him on Rhodes in order to stop his activities, but he couldn't be found anywhere. Meanwhile he continued running his expedition despite the fact that three Greek and some German operators told him to stop because of the PTT decision.

To make a long story short, DL7FT was found on May 21 at the Ramira Hotel on the island of Cos, the second most populated among the twelve Dodecanese islands. You see, he got his license for Rhodes but went on to Cos . . . you may imagine why.

His operation was stopped and his radio was sealed and kept at the airport customs office to be given back to him at his departure from the country.

And now the grand finale! During a conversation with Don Search, Don told me that DL7FT had provided him with all necessary papers including a Mt. Athos one just like the one I had in 1980 for my trip! Since all papers arriving at the DXCC desk are treated as confidential, Don couldn't do more than provide me with permit numbers and dates.

A letter was forwarded to a friend of mine in Mt. Athos the next morning with all the details in it, and a few days later the matter was revealed. The Mt. Athos community had never issued such a license, Mr. Turek was unknown, and most important, the protocol number did not match with those issued by the community.

I leave the conclusions to you. Not hard to guess.

Common sense now says that it will be even more difficult to get a written permit for Mt. Athos again after all these sad events. We hope we will not have to face the unhappy situation of seeing Mt. Athos among the deleted countries. We believe we should have nothing more to do with DL7FT's operations; we regret that a DXCC Honor Roll holder should have provided such an example to younger DXers—making the DX-CC certificate look like a piece of worthless rubbish.

By the way, I will be glad to forward any documents to anyone who would like to look at them. Please do not bother the editors of *73* but send your request, if any, to me direct.

GREEK DEMOCRACY
MINISTRY OF TRANSPORT AND COMMUNICATIONS
DEPARTMENT OF POST AND COMMUNICATIONS

ATHENS 24/4/86

Ref.No. : 58869

Degree of priority : VERY - URGENT

POSTAL ADDRESS : 49,SYNGHOU AVE.
POSTAL CODE : 11780 ATHENS
FOR INFORMATION: Mr.N. CHRISTOPOULOS
TEL : 923.2906

TO:
The Security Dept.of Rhodes,
85100 RHODES
NOTIFICATION TO : Radio Amateur Association of Greece,
P.O.BOX 3564 Athens 10210

MATTER IN HAND : REVOCATION OF TEMPORARY LICENCE FOR OPERATING AMATEUR RADIO STATION.

We acknowledge that in our letter (ref. no. 52352/29-1-86) which was also sent to your office we granted a temporary licence for possession and operation of an amateur radio station to the German radio amateur Mr. FRANK TUREK.

Since the aforementioned, in accord with a written report made by the Radio Amateur Association Of Greece, exhibited wrongful behaviour toward the Spirit of Amateur Radio violating even the current regulations (such as using a false call-sign, a phoney declaration that he was transmitting from Mt. Athos which is forbidden,making sarcastic and derisory remarks to Greek Amateurs etc.) Our Department revokes his licence which it had granted.

Therefor,since Mr. Turek in his application said that from 3rd to 25th May he could be in RHODES,we request that you locate him to take away his licence for possession and operation of his amateur radio station (ref. no. 52352/29-1-86) and to seal up his radio equipment which is an ICOM transceiver model IC-730 serial no. 06027, so that he will not be able to use it until his departure from Greece.

Our Department will at the same time notify the corresponding German Ministry.

The Supervisor of Ministry Of Transport and Communications

S.BARABOUTIS

SV1DC prepares to erect the antenna on the monastery roof, 1980.

The erected antenna at Mt. Athos, 1980.

INDONESIA

Erlangga Suryadarma YBØBZZ/V85BZ
ORARI National OSL Bureau
PO Box 96
Jakarta 10002
Indonesia

August and September report by YBØBZZ and Ben S. Samsu YBØEBS.

The International Beacon Proj-

ect (IBP) has not been considered by ORARI [Organisasi Amatir Radio Indonesia] at the present time. However, realizing that the present established IBPs in IARU Regions I, II, and III are well spread geographically [and] Indonesia is strategically situated at the intersection of two major continents and two major oceans [it] is also a "mid-point" [and a] suitable location. Should there be any plan within the IARU Region III association in this matter, ORARI will highly extend its support and cooperation.

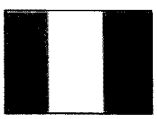
[ORARI plans to add to its calendar of annual events an International QRP Day, probably on June 17 since that is the day so proclaimed in IARU Region I. This is because of the new feeling of "the bigger the better" resulting from the increase of imported equipment and bigger antennas and bigger power.]

It is the opinion of ORARI that whilst some of the world contests such as *CQ* WW have a very strong foothold in the world amateur activity, it is of great pity that the one and only World Amateur Radio Day was not celebrated by all amateurs accordingly. ORARI wishes to appeal that this special day should be programmed . . . as the most important and greatest event, and all IARU society members [think of themselves as] obliged to participate.

ORARI wishes to support the establishment of a common frequency preserved primarily for DX requirements which in no condition except for emergency communications will be utilized for local communication. This will preserve also the segment for DX contest purposes, as, at present, it tends to be fully blocked by local communications in that segment. Example of this is the usage of DX-window segment in the 80-meter band.

This report will conclude next time with a section on the new band plan.

ISRAEL



Ron Gang 4Z4MK
Kibbutz Urim
Negev M.P.O. 85530
Israel

FLASH!

Easter in the Holy Land with the Holon-Bat-Yam Club! [You can be there!] In the last edition of this column I reported on the week-long 4X5J operation of the Holon-Bat-Yam radio club, ending my comments by stating that I didn't know what they had up their collective sleeve for the coming year. Since then, the dust has cleared and it has become evident that they really intend to outdo themselves for this coming spring. Thus, I have the pleasure of announcing to the readers of *73* their project, which will consist of the simultaneous operation of five stations bearing special callsigns, from five separate locations: Bethlehem, Jerusalem, Nazareth, Mount Tabor, and the Mount of Beatitudes (above Capernaum on the Sea of Galilee). The operation is to take place from the 23rd through the 30th of April.

In order to man these stations around the clock, the club is looking for 50 or more overseas radio amateurs, who are invited to come with their families, who will take turns operating the stations, and will be sightseeing on their days off. Operators should be experienced in handling pileups and preferably should know how to make QSOs in a few languages. Those interested in this combination of holiday and hamming should write to Aharon Kirschner 4X4AT, HaRakefet 17, 58204 Holon, Israel.

As with the Holon-Bat-Yam Club's 4X5DS (Dead Sea) and 4X5J (Jerusalem Old City) operations, special QSLs and certificates will be sent free of charge to those making contact with the Easter-1987-In-The-Holy-Land stations.

Italy

Herewith additional information from the IARS [International Amateur Radio Service]; see 73 International *for July, 1986, also. The IARS was founded as a private, nonprofit organization by I4CMF and I4OCS for the aim "of promoting friendly relations between radio amateurs throughout the world by assisting in negotiating reciprocal licensing agreements between Italy and other countries." The organization "considers the six universally recognized and accepted articles of the Ham Radio Code [Paul M. Segal—see any edition of the* ARRL Handbook*] to be the guideline for their activity, with mutual respect for each person's rights and duties."*

The latest country with which Italy has reached a reciprocal licensing agreement "is the 'oldest' and 'noble' Republic of San Marino, very well known also as 'Monte Titano' (Mount Titan), from the name of the main peak of the land. We are very happy to give you this news because this agreement is the first one that our 'small' neighbor has reached in its history of radio amateurs."

Eighteen other countries have such agreements with Italy. The IARS emphasizes the need to observe all "bureaucratic formalities which, unfortunately, continue to exist because each country still continues to carry along its own set of regulations. However, it is hoped that with the institution of the 'European' license, promoted by C.E.P.T., free circulation rights will be granted to European ham operators. This objective is a particularly important one which IARS is committed to and which it is counting on achieving soon. The goodwill and desire to work towards a goal which will bring OMs throughout the world a little closer together, with no distinction of race, nationality, or creed, is certainly NOT lacking!"

ZAMBIA

Daniel E. Soko 9J2DS
PO Box 71831
Ndola
Zambia

Welcome, 9J2DS, Secretary and Awards Manager for the Radio Society of Zambia. We will be pleased to hear more from you not only about Zambia but your neighbors also: Tanzania, Malawi, Mozambique, Zimbabwe, Namibia, and Angola, and even more distant neighbors in southern Africa.

At present, Zambia has 30 licenced radio amateurs, although about ten would be considered very active. The Radio Society runs a weekly net on 3.645 MHz every Friday at 1900 UTC. A rough check on Tuesdays at 1730 UTC on the same frequency may reveal a bit of activity as well.

Any ham is welcome to 9J2-land, and it would be helpful to all if you would send a photocopy of your licence well in advance to make arrangements for a possible temporary licence. Send it to me as Secretary of the Radio Society of Zambia at our headquarters and QSL Bureau: PO Box 20332, Kitwe, Zambia.

This year alone we were privileged to see Lloyd and Iris Colvin, W6KG and W6QL, for a short while. Lloyd was given the call 9J2LC, and Iris, 9J2IC. The couple operated mainly from their hotel room in Lusaka using their own equipment.

Soon after, a visit was made by Dilip 5Z4MR, who was issued 9J2DRT. He also qualified for the WZA after contacting ten stations within Zambia. Special callsigns are issued from time to time mainly on application to the licencing authorities.

Only five have 2m rigs and they are scattered about. A lot of interest is shown for 144-MHz operation, but finding equipment is a big hindrance. The five have thought of a repeater or two, but the same problem of equipment is manifested. Any kinds of donation in the form of kits for repeaters and actual 144-MHz rigs which may be obsolete, from other hams, but still in good working order would be a great step. . . . [What have you or your club to give? Let *73* International know about any donations! With photographs if possible.]

Hams are permitted to operate mobile as well. Third-party traffic, however, unfortunately cannot be discussed.

The WZA certificate may be won as follows: 9J2 stations contacted on 7, 14, 21, and 28 MHz count one point; on 10, 18, and 24 MHz, two points; and on 1, 8, and 3.5 MHz, three points. Special prefixes count two points. Same stations contacted again on other bands count again. Zones 36, 37, and 38 need 20 points for the award; all others need 10. The award is available to SWLs; there are separate classes for AM, CW, SSB, and mixed. Send certified copies of logs to Awards Manager with 10 IRCs, 50 pence, or US$1.

Let us hear from you! 73, Daniel. ■

NEVER SAY DIE

from page 62

My recommendation for getting into your own business is to either start at home in a small way and learn so your mistakes won't blow your cash reserves—or learn on someone else's money. Just about every entrepreneur eventually needs help as his business grows, providing you with exactly the learning experience you need—just not at your expense.

If you don't blow your best learning years—from 45–65—when you get into the time of life that larger businesses normally throw you out to die, you'll have your own business and not have to worry about which ham magazine you can afford—or even which rig to get. You'll get the best—and perhaps a spare to take along on trips to Africa the way Lloyd and Iris Colvin do.

Then, when I ask in an editorial who's interested in going down to some obscure Caribbean island with me for a few days of instant DXing, I'll get an enthusiastic letter from you. The fact is I'm writing this editorial while sitting on the beach on Cayman Brac, a tiny island south of Cuba. It's skin diving heaven, so I've been here taking underwater pictures of the beautiful reefs.

Now here's an island which is easy to reach—has very nice hotels and great food—wonderful skin diving—is surprisingly inexpensive. . . what a great spot for a continuing DXpedition! What I have in mind is setting up a first-rate ham station for you to time-share—like a condominium. I haven't priced everything out, but I'll bet we could offer three days of hot DXing, including hotel, food, and transportation, for under $750.

Having done a good deal of DX-peditioning, I can assure you it's an experience you'll never forget. The Caribbean is an ideal spot, too, because it's easy to get to—there are nice hotels (beats the heck out of tents)—licensing is easy—the weather is usually excellent—transportation is convenient—it's close by—and, best of all, the propagation into the U.S. is first rate.

DXing from Lesotho (my call there: 7P8CA), for example, has its drawbacks—like taking a long time to get there—costing a bundle—and then, once you're there and on the air, you don't hear much. Really a great combination.

Speaking of entrepreneurialism, *Insight* magazine had quite an article on the problems American Indians have been having. It seems they, like the blacks, have a culture which does not encourage entrepreneurs, with the result that the Indians are gradually losing everything. They're poor as a group and staying that way.

Our educational system generally supports this lack of prestige for business people. College, in particular, aims at preparing graduates to work in large businesses, for the government, or for teaching. If you think about it, you'll recognize that these are the three best career paths to never make any serious money. College seniors are beseiged by recruiting teams from our large corporations—a kind of feeding frenzy takes place which sweeps most graduates into these virtually dead-end career paths.

A couple times during my life I came close to working for the government. After WWII ended I was teaching electronics at the submarine base in New London. When it came time for my release from involuntary servitude I was anxious to get the hell out. I'd risen to a first-class electronic technician. During the war the Navy had refused to let any of the ETs sign on as regular Navy, so suddenly they found themselves losing the people they needed the most. I was offered a Lt. Commander's rank if I'd stay in and teach. I might have stayed if they'd upped it to Captain. Close call!

Another time, after I'd gotten absolutely fed up with being a television director, I applied for a GS engineering position. By the time they got around to accepting me, better judgment had fortunately taken over. That's when I made my first big entrepreneurial leap, starting a loud-

Frequency standard upgrades your counter

Get the precision you paid for from your frequency counter. Connect the Counter-Mate to the "EXT STD" input or periodically check the internal oscillator to get traceable accuracy instead of just resolution.

The Counter-Mate frequency standard employs a precision third-overtone 10 MHz crystal in a proportionally controlled copper oven maintained at a computer optimized temperature. The excellent long-term and short-term stability is in a class with units costing much more.

Check the specifications—the Counter-Mate out-performs and is less expensive than most counters' oven oscillator options, it needs no installation, and it has sufficient drive to serve several instruments.

The Counter-Mate comes calibrated against national standards and you do not lose your counter when it is time to recalibrate! The unique 50-turn adjustor makes calibration easy and mechanically stable. Periodic calibration at Wenzel Associates is just $15 plus shipping.

COUNTER-MATE SPECIFICATIONS

Model	CM-1
Frequency	1 MHz and 10 MHz
Output Drive	TTL and 50 Ohm
Rise & Fall Time	5 nsec
Aging Rate	< 3x10 -8/Month
Temperature	< -5x10 -8, 10° to 40° C
Setability	2x10 -9, 50 turns
Oven Warm-Up	10 minutes at 25° C
Power Requirments	9V Adapter included
Size	4.6" x 4.8" x 1.6"

speaker cabinet firm with a $1,000 car loan.

I'd like to see our colleges include courses to help people become entrepreneurs. Small business is the strength of our country, so it should be encouraged and youngsters should get educations which help them in this direction. I'm no fan of big business. I've got a book written by a VP of GE called *Big Business, a Threat to Democracy*. He makes a very good case.

Big business is driven by quarterly business reports—so we see lobbyists in Washington protecting their interests—a general lack of regard for the environment or people. We see cigarette firms selling their proven killer drug to millions of helpless addicts. I watch with pain as the few nicotine drug addicts who work for me sneak out back of the building for their drug fix every hour.

Life is a gamble. Every day we gamble as we drive or even walk across the street. Yet I see people refusing to go to Europe on vacation because they don't want to gamble on being the target of a terrorist, yet who take a far, far greater gamble by smoking. Talk about rolling with loaded dice! Cigarettes are just as deadly as Russian roulette—it's just a longer game. How soon will it hit is the question. Will it be cancer? Emphysema? A heart attack? Will the cancer be in the throat? Lungs? Intestines? Or will it be a stroke? Will you be hit before you reach 70? The odds are enormous that you will.

So we see big firms throwing every legal obstacle they can in the way of any government regulations which might slow down their polluting and poisoning. The alarms about the damage to our upper atmosphere are being verified—the result has been a stepping up of lobbying to prevent government action, not major efforts to develop chemicals which will not cause this apparently irreversible damage. So we continue to use spray cans—and produce millions of tons of refrigerant a year. The profits in the next quarter are a lot more important than what happens to the world in 50 years. Other than being needed to compete with other huge businesses from other countries, it's difficult to justify most big businesses.

Small business provides more jobs, more wealth for the people, more innovation—and even pays more taxes. Of course small business doesn't offer quite the gambling opportunities we get with large corporations, with their stocks and bonds and our stock exchanges. And without our megabanks, how would Third World leaders ever get the billions for their Swiss accounts?

The compact disc business is growing rapidly. I've been visiting CD-only stores in recent months. Just about every one I've visited has been able to get into the black in three to five months—not bad for opening a new store. Entrepreneurs who keep a weather eye on technology have an edge. I'm in the process of changing my computer store chain into high-tech stores, adding telephones, compact discs, CD players, and a few other high-tech gadgets. If the 8mm video firms decide they're going to make a major effort, we'll add an 8mm department too.

There are opportunities at every turn for the entrepreneur. Every new technology opens opportunities for new products to be designed, manufactured and marketed. A thousand small outfits sprang up with TRS-80 support products a few years ago, with hundreds of them doing very, very well. That was before IBM outsmarted Radio Shack, taking advantage of the incredible Radio Shack blindness to the power of third-party support of their computers. Well, that blindness cost Radio Shack tens of billions—and gave IBM the microcomputer industry as a gift. So, instead of IBM having to put out a TRS-DOS computer, we see Radio Shack resigned to bringing out MS-DOS computers just to survive.

If we can get amateur radio growing again as a hobby and as a market, we'll need hundreds of new ham products—antennas, tuners, amplifiers, packet equipment—things which you might just be able to design and start making. In the meanwhile you might want to see what you can come up with for compact discs, for 8mm video, communications, security, or any of the other new high-tech fields. It can be any product, service—or even information.

You get too soon old and too late smart, as the saying goes—so the sooner you start thinking

"When You Buy, Say 73"

in terms of being independent economically, the better. It's bad enough to work at a job all your life which doesn't allow you to splurge now and then, but then to face retirement with even less...? Imagine, having so little money that you have to pass up subscribing to a ham magazine you enjoy!

The early conditioning we get from our parents is important. My grandfather was an entrepreneur—made millions as an inventor in the 20s. He lost everything in the 1929 stock market crash, but that didn't faze him. He got right back into business again marketing a new type of indestructible brake lining invented by an uncle of his. My father was an entrepreneur—started the first transatlantic airline—so I had the right mind-set to be an entrepreneur. And that's important, as we can see from the black and American Indian experiences, where social priorities are keeping these groups from success.

BEING DISAGREEABLE

The theme at the *73* booth at hamfests for years has been, "I enjoy your editorials, but I don't always agree with 'em." Excuuuse me, but that's a cop out, so let's think this one out.

First, many more bureaucratically inclined readers have a problem with my whole way of writing. I'm amazed at how many words some writers use to communicate their ideas. Being of Yankee lineage, I tend to try to get across my ideas with as few words as possible. Yes, I know my editorials seem to go on endlessly, but—hey—take a closer look and you'll see I've covered a wide range of topics, none in any exhaustive detail.

Readers who are more used to writers who endlessly repeat themselves, rather than using my approach of just presenting almost an outline of the ideas, often have a problem. I've never been paid by the word, so I've never developed the redundancy system of writing to maximize my income with a minimum of ideas.

I'll tell you what. The next time you get the feeling that you're not agreeing 100% with what I'm writing, let's see if you're operating on the basis of my disturbing a belief of yours or if you actually have some data that I don't which might lead me to different conclusions.

Now, if we're having a difference of belief—a religious difference, you might put it—let's remember what my grandmother used to say—a man convinced against his will is of the same opinion still. And on quite a few ham subjects we're as much up against religious fanaticism as are the Moslems vs. the Christians, the Moslems vs. the Jews, the Protestants vs. the Catholics, and so on. Like no-code, for instance, where the born-again agnostics are up against old-timer intransigence. Heh!

So, instead of taking the easy out of just not agreeing with me, let's see if there's really any substance to your disagreement. Let's see if you can articulate your objections. I suspect you'll find as you try to explain yourself that you are operating on some weak premises. You may begin to suspect that if I'd hammered my ideas home over and over again—preaching the sermon, so to speak—you might have agreed with me. Well, I don't. I try to put as much meat into what I write as I can, leaving out the fluff, fat, and overkill.

Now and then I've pinned down readers who claim they don't always agree with me. "Okay, name one thing I've written with which you don't agree." This often flusters people into generalities or sudden memory loss (SML). Instant amnesia. When a specific area of disagreement is cited, I appreciate it because I can then find out if I'm up against a religious conviction or a question of facts. If I am wrong about my facts I sure want to know. What usually happens is that my facts are a lot more solid—or I'm able to bring to light some of the background on why I wrote what I did.

You see, I have a psychological problem. I was brought up in a family where any vague statement was challenged, so I learned early on to do my homework or suffer the embarrassment of Being Wrong! The dictionary was whipped out at the slightest question about a word's meaning or pronunciation. This helped me build a larger than average vocabulary.

So let's bring this business out in the open. The next time you find yourself disagreeing with me about something, is it because

here is the next generation Repeater

MARK 4CR

The **only** repeaters and controllers with REAL SPEECH!

No other repeaters or controllers match Mark 4 in capability and features. That's why Mark 4 is the performance leader at amateur and commercial repeater sites around the world. Only Mark 4 gives you Message Master™ real speech • voice readout of received signal strength, deviation, and frequency error • 4-channel receiver voting • clock time announcements and function control • 7-helical filter receiver • extensive phone patch functions. Unlike others, Mark 4 even includes power supply and a handsome cabinet.

Call or write for specifications on the repeater, controller, and receiver winners.

Create messages just by talking. Speak any phrases or words in any languages or dialect and *your own voice* is stored instantly in solid-state memory. Perfect for emergency warnings, club news bulletins, and DX alerts. Create unique ID and tail messages, and the ultimate in a real speech user mailbox — only with a Mark 4.

Kantronics UTU-XT

NOW — for ANY computer, the intelligent terminal unit that can change its spots.

Can you imagine a terminal unit (TU) that has user programmable parameters? Would you like to be able to vary the MARK and SPACE tones you use by computer control, save these parameters for next time, and be able to change the center frequency and bandwidth of the CW detector? All this can be done with the **Universal Terminal Unit-XT by Kantronics.**

Imagine a **CW/RTTY/ASCII/AMTOR** machine that operates with a TNC-like command structure, including **54 commands.** The UTU-XT does just that with a 6303 microcomputer, 2K of RAM, NOVRAM, and 128K of EPROM embedded inside.

UTU-XT is also compatible to any computer with an RS232 or TTL (C-64) serial port — the circuit is built in. This allows you the flexibility to change computers at any time.

UTU-XT operates CW from 6-99 WPM, RTTY from 45 to 300 baud. ASCII from 110 to 300 baud, and AMTOR modes A, B, and L. Selective RTTY and SELFEC are included.
Suggested retail $359.95

you have some beliefs which I've disturbed or do you really think I'm working with poor information? If you've got data I don't, let's see what you've got.

I'll be glad when we're able to use our home computers to cross-index magazines and books. I've read around 6,000 books so far, plus perhaps 2,500 magazines a year, but, like everyone else, my retention of details is low. It would be nice to be able to quickly find the reference to a recent *Business Week* article on how much of a loss of income on the average we're going to have because the U.S. is changing to a service and sales economy instead of one based on manufacturing. I remember the general article, but time is gradually erasing the details.

Think how much more valuable magazines (and books) will be when we are able to easily search them with our computer for information. It'll be along, and when it comes I'll be one of the first users.

Speaking. . . no, writing about manufacturing going overseas, the new tax laws should substantially accelerate the movement of manufacturing to Asia—just what we need. This will then tend to reduce our overall income by about 40%. You see, the new tax laws have increased the taxes on business. Now if we weren't up against foreign competition, we could just go the old route and say what the hell and raise prices to pay the increased taxes. But there are fewer and fewer industries where we aren't in price competition with imports, so increased taxes will mean we'll have to move the manufacturing to lower-wage countries if we're going to stay in business. I believe we'll see business fleeing America faster than ever.

Moving taxes from people to business may feel good, but it's pernicious. The Japanese don't tax their businesses, which may help to explain how they are able to be so incredibly competitive, even with the yen increasing in value.

This is going to put pressure on even the small businessman to find an Asian partner in order to keep his costs of manufacturing down. I'll bet I'll be seeing more and more businessmen on the October Asian consumer electronic show tours in the next two or three years.

You say you disagree? Okay . . . let me know where you think I'm wrong. I sure wish I were, but it looks to me as if Congress is at it again, waving in the winds of election fever—a 365-day-a-year plague in Washington.

Let's not play the old "I don't always agree with you" tune. If you're going to be disagreeable, then sit down and send me your facts. Or do I have to start doubling the length of my editorials just to bludgeon you with the details which resulted in my conclusions? Yes, I know everyone is lazy and I'm a damned nuisance when I make you think. Hey, no one is holding your eyelids open and forcing you to read my editorial—that's just self-inflicted torture, so stop being disagreeable about it.

BIG RIG NEEDS HOME

I've got just what you Big-Gun DXers in Southern California will love—a ten-kilowatt sideband rig someone wants to give away for free. Does that make your little heart go pitty-pat?

The rig is a model GPT-10K, made by The Technical Materiel Corporation in Mamaroneck, New York. It's not exactly a brand new rig—manufactured in 1962—but it's a 2–28-MHz rig—imagine the fun you can have on 40m! Hey, no fair taking over WWV's channels, okay? This could make quite a dent on CB also, eh? Talk about real punch!

The rig is located in Southern California (naturally). It's a big mother—six-foot rack—must be near five feet wide—on wheels (whew!).

How to win it: The rig is available to any ham or ham club which can come up with a damned good reason for getting it. You'll have to go and get it—with a truck and some riggers. Write your rationalization for getting this rig on one page and send it to me. My decision (and that of the owner) will be final. No bribes, okay?

This rig, made for the Army, is built like all TMC gear, like a brick outhouse. It's a beaut! I remember their old GPR-90, the best HQ-129 ever built. TMC disappeared from the ham scene about the same time as everyone else, right after the Incentive Licensing disaster hit us. They sure did make fabulous radio equipment.

All that's needed to make this rig legal is a heavy shunt on the final plate meter.■

Although the forecast for the last week of the month looks good at this time, there is always the possibility of a disturbed geomagnetic field due to unforeseen solar influences. In general, November looks as if it will support good HF propagation to all parts of the world except on the days noted. Note the trends. You may expect poorer conditions centering around the 3rd, the 13th, and the 23rd of the month.

D'JA SEE THE *NATIONAL GEOGRAPHIC*?

The October issue of *National Geographic* got me all excited—three new republics about to be formed in the Pacific! In case you're not an *NG* reader, the three new republics which are being made from U.S. trust territories which have been under the auspices of the U.N. are the Republic of Palau (Bilau), the Republic of the Marshall Islands, and the Federated States of Micronesia.

Presumably these three new countries will have to form their own FCCs to regulate communications and issue licenses. Presumably they'll have new call prefixes to go along with their new status. Presumably there will be the usual panic to get these worked and confirmed.

Also being formed is the Commonwealth of the Northern Mariana Islands, but I suspect this will be about as separate a country as Puerto Rico. It'll be the same in country status as before—probably with no call prefix change.

The article in *National Geographic* was vague on just when these trust territories would assume republic status—this hinges on a U.N. confirming vote. The countries have their new flags and are getting ready to be in business.

For the last two years I've been trying to work some time into my schedule to get to some of these islands—to do some DXing—take pictures and skin dive. I had in mind visiting Palau, Truk, Ponape, Majuro, and possibly Yap. It's a long time since I've been to any of those places.

During the war I got to Majuro for a couple of short vacations. Majuro is a large atoll made up of a ring of islands around a beautiful lagoon. Each of the islands had been given a girl's name—the submarine rest camp was on Myrna and the submarine tender there was the *Bushnell*, named after a great-great-grandfather of mine who invented one of the first submarines.

It was in the Majuro lagoon that I did my first skin diving, using a Momsen Lung which I'd converted. I was unable to convince anyone else to even try it. It was also on Majuro that I heard about Amelia Earhart and Fred Noonan crashing in the lagoon on their ill-fated flight to Howland Island—they and their plane were removed by the Japanese, who owned the islands at that time.

The submarine rest camp at Majuro was fine—you couldn't ask for a more beautiful spot with white sand beaches, an incredible lagoon, palm trees, and a perfect climate. We went there twice in 1944 for two-week rests while the tender repaired and updated our boat. Our barracks were in Quonset huts—there were movies every night—followed by gedunks (ice cream). When we arrived, the first order of the day was to get our mail—then our pay. This was followed closely by a flurry of poker games which moved most of the money into the more skillful hands. Those were some of the highest stakes poker games I've ever seen—except in the movies.

I remember when we arrived at Majuro for the second visit. Normally gambling wasn't allowed on the boat, but once we were tied up at Majuro the taboo seemed to be off and a 25¢ limit poker game sprang up in the crew's mess. Being normally a very lucky card player, I sat in. I've never had such a run of bad luck in my life—we played for about four hours and I didn't win one single hand. The only winnings I had were on side bets on who would have the worst hand—I did pretty well with

"Are you the handsome one who advertised for 'Ham Help'?"

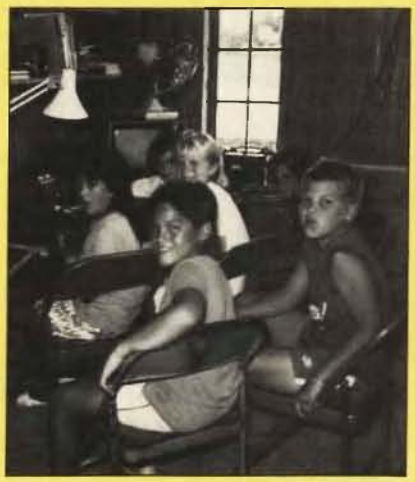
In Orbit



AMATEUR RADIO may soon have a permanent presence in space! Roy Neal K6DUE, Vern Riportella WA2LQQ, Bill Tynan W3XO, Larry Price W4RA, Dave Sumner K1ZZ, and NASA's Dr. Tony England W0ORE met recently to discuss the possibility of including a ham shack on board the U.S. manned space station due to fly in 1995. Three main functions will be stressed in a proposal to be submitted to NASA early next year: recreation, utilization, and education. The station will be used to give astronauts something to do in their spare time during their long months in space, and an "autopilot" mode is planned to allow the equipment to be used as a flying repeater (that way the system could be utilized when the astronauts are not using it, instead of just sitting idle on the shelf). The most exciting aspect of the project is education. One idea is to have a set of roving vans outfitted with communications gear which would periodically visit school classrooms. The students would get a chance to talk one-on-one with the scientists aboard the spacecraft; a one-way fast-scan downlink is also being considered so that the children can also see who they are talking to. The space station program is a result of President Reagan's 1984 directive to place a permanently manned platform in space.

Youngster

THE WESTLINK REPORT has announced the winner of the 1986 Young Ham of the Year competition. **Shawn Alan Wakefield WK5P** received the honor at the Ham/West convention in Las Vegas (thanks to Yaesu for picking up Shawn's air fare and hotel bill). At the banquet, *Westlink* Editor Bill Pasternak WA6ITF cited Shawn's outstanding contributions to the hobby, including the formation of a ham radio Explorer's Post and the creation of a ham club at his high school. Shawn is 16 years old; with a record like his, the future looks bright.

Camp Kudos

THE DAYTON AMATEUR RADIO ASSOCIATION went to camp this summer. **John McCoy NS8A**, backed by DARA, spent six weeks at Camp Kern, a branch of the Dayton YMCA, introducing youngsters to the excitement of ham radio. Equipment was donated by ICOM, Moseley, and Butternut, and a complete HF/VHF/packet station was set up in an old bath house. The original DARA plan was to demonstrate ham radio to the campers, then contact them after the summer to enroll them in classes. John, however, decided to go full bore and encouraged the kids to earn their Novice license in one week! The result? Seven new Novices in the first one-week session, with 13 more licensed in the remaining five sessions. The sixteen boys and four girls ranged in age from nine to fourteen years old. John says that the biggest problem was answering the children's questions ("What's a hernia operation?") and finding interesting people to talk to on the air. It was also a bit difficult, he says, to explain to the kids that they had to learn Morse code . . . especially when the packet station across the room was spewing out error-free data at 1200 baud. Would he do it again? Yes! In fact, next year's plans include expanding the program to two more camps.

Kids at Camp Kern crowd around the operating position.

Rumor Or Fact?

WE MIGHT AS WELL confirm the rumors that have been floating around concerning a new DX award . . . look for an official announcement and rules for *73*'s version of DXCC in the January, 1987, issue! Here are a few tidbits to whet your palate: Nearly 400 countries are on the list (ARRL's DXCC has just over 300); everybody starts at zero on January 1st; there won't be a big headache with card-checking; about twenty special endorsements are available. This award is the one to shoot for!

Is It Art?

THE ARRL is sponsoring a national art contest for students. First, second, and third prizes will be awarded in three age categories (8–12, 13–15, and 16–18), and the winning entries will be sent along to a worldwide competition sponsored by the ITU in Geneva. The theme of the contest is "Youth In Amateur Radio." The judges are looking for original art depicting the student's impression of ham radio in a photograph, drawing, painting, or illustration. Artwork should be no larger than 11 x 14 inches, and must be accompanied by an official entry form. Each entrant must be sponsored by an ARRL member—a list of sponsors and copies of the entry form are available by writing to the ARRL, Department Y, 225 Main Street, Newington CT 06111. The deadline for entries is February 1, 1987.

Stoner Stoned

THE FCC has said "no" to Don Stoner's **Public Digital Radio Service**. Stoner wanted to put a no-code, low-power packet service on a portion of the amateur six-meter band (52–54 MHz). Don's system went to great extremes to avoid interference to television reception, including smart controllers that would automatically reduce the transmitter's power to the minimum level necessary for communication (we need that on 20 meters!). The biggest stumbling block to Don's request is an agreement at WARC-79 that the spectrum from 50 to 54 MHz would be exclusively allocated to hams in Region 2. In dismissing the petition, the commission suggested that another home be found for the PDRS, possibly at 900 MHz. Our 902–928-MHz allocation is not exclusively amateur. I think that the FCC is being very positive about the creation of this new service, and a PDRS should become a reality once the technical details can be worked out.

Exams Examined

NOW THAT the volunteer examiner system has proven itself, the FCC is looking toward getting out of the examination business completely. In a recent Notice of Inquiry (FCC 86-400), the commission proposes handing over commercial radio operator examinations to the private sector. This would save the FCC money and provide more testing opportunities. Comments are being solicited regarding whether handing over commercial testing is a good idea, and if so, how examiners should be picked and funded; send your comments to the FCC, 1919 M Street NW, Washington DC 20554.

Test Tip

IT'S NEARLY TIME for another edition of the popular *73* World SSB Championships, scheduled for January. Now is the time to send off for your official log sheets—drop an SASE in the mail to Bill Gosney KE7C, World Championship Contests, 2665 North Busby Road, Oak Harbor WA 98277. You'll find the results of the 1986 160- and 75-meter contests starting on page 50 of this issue.

House Hams

AN INTERESTING CONCEPT has been put forth by **Jim McNalley** in a working paper released by the FCC's Office of Plans and Policy. Jim suggests that it would be nice to allow members of a household to use ham equipment to communicate with the station licensee when he or she is mobile or portable. In other words, you could chat with your wife on two meters while you were driving home, even if she doesn't have a license. Communications would be identified by the station call. Jim feels that such a modification to amateur radio would increase the value and popularity of the service, and that the ham community could exercise enough discipline to keep the operation clean. This isn't an NPRM or NOI or anything official; it's just someone at the OPP blue-skying. We certainly should give it some thought, though, and we'd like you to drop *73* a note telling us whether or not you think it is a good idea. The address is *73* Magazine, WGE Center, Peterborough NH 03458, Att: OPP.

Culled Calls

HERE'S SOME MORE INFORMATION on the proposal to allow hams to choose their own callsigns. Basically, the FCC has decided that it would be no trouble at all to let an outside organization issue "special" calls. The commission would still issue a callsign to each licensed amateur; you then would have the choice of using that call or applying for a special one. There haven't been any firm proposals submitted yet, but tentative plans have calls costing between $20 and $30. Priority would be given to requests for calls that were lost due to a move into a different area (remember when you had to do that?), and requests for calls of Silent Keys by a family member or memorial station. One hitch in the idea is that the FCC would like to spread the responsibility among several groups (similar to the VEC program). This certainly complicates record keeping—all of the organizations would have to share a data base. Also, the League has indicated that they are interested in issuing callsigns *only* if they have exclusive authority, something that may not be legal under antitrust law.

ECPA Passes

AMIDST A BIT OF CONFUSION, the Senate has passed the Electronic Communications Privacy Act. The ECPA was tacked on to a drug-abuse program bill that passed easily. However, there is some concern about the method used to get the ECPA through Congress—specifically, a report must be issued by the House Judiciary Committee before it can be sent to President Reagan for his signature. The Act is much different from the version first proposed, which sought to make illegal reception of just about every common-carrier radio service. The ECPA passed by the Senate makes legal the reception of cordless telephones, pagers, marine and aeronautical communication, ham, CB, GMRS, government, law enforcement, police, and fire transmissions. About the only thing that it is illegal to listen to is cellular telephones. It's nice to see the Act toned down, but I still think that any restriction on reception of radio signals is a violation of a fundamental right. Is it time for a bit of civil disobedience?

Found, Fined

I KNOW I PROMISED not to mention Herb Schoenbohm KV4FZ for a while, but his name popped up in connection with a recent FCC raid in the Caribbean. Acting on several complaints from hams, engineers from the San Juan field office tracked down **David Ackley W4UWH** on St. Thomas, who was intentionally interfering with a net on 40 meters (doubly bad since David has a Technician-class license). Herb's name comes up because Ackley was retransmitting taped recordings of KV4FZ. W4UWH was fined $1,450 for his violations.

Aloha

THANKS to our friends at *The Westlink Report*, *Amateur Satellite Report*, and *The W5YI Report* for help with this month's QRX. Also, since it's that time of year (again!), best wishes for a safe and happy holiday season.

CONTINUOUS COVERAGE ANTENNAS FOR COMMERCIAL & AMATEUR SERVICE

Model AC 1.8-30 — 1.8 to 30 MHz

- SWR Max 2:1, 1.4:1 average from 1.8 to 30 MHz
- Can be installed in approximately 80 ft space
- Ideal for commercial services for multi frequency operation without the need for antenna tuners or additional antennas
- Handles 1 KW, 2 KW PEP ICAS
- Higher power models available on special order. Contact your dealer or factory

$159.50 SHIPPING & HANDLING ADD $4.00

U.S. Patent No. 4,511,898

Model AC 3.5-30 — 3.5 to 30 MHz

- SWR less than 2:1 from 3.5 to 30 MHz
- Complete assembled Balun terminated with standard SO-239 connector
- Power capability 1 KW - 2 KW PEP ICAS. Higher power model is available on special order.
- Designed for 50 ohm feedline
- Weather proof balun and balancing network

$167.50 SHIPPING & HANDLING ADD $4.00

NEVER SAY DIE

from page 4

that. So, even with the quarter limit, I found myself out a couple hundred dollars—a month's pay. I went to the next table where a crap game was going and won it all back (and more) in about two minutes.

You can tell me all you want about there not being any luck in gambling—it's statistically impossible to lose for four hours. No, no one was cheating.

Another sport at Majuro was making Gilly. When our crew went ashore they took along the coffee urn, complete with the special insides made by our machinists so it would distill torpedo (denatured) alcohol into a slightly less deadly fluid we called Gilly, which was mixed with canned grapefruit juice. Soon we had drunken sailors staggering around throwing huge chunks of coral on the tin Quonset hut roofs, yelling "depth charge!"

It'd be fun to get back and see Majuro again. I'm sure nothing is left of the rest camp on Myrna, just as there wasn't a sign of Camp Dealey on Guam—only a gas station with the name.

I'd enjoy visiting Palau and Yap, too. The last time I was there we had to stay about a mile offshore in our submarine. We did lifeguard duty at Yap when Navy aircraft raided it. We chugged around on the surface watching for any downed American planes. The Japanese planes, frustrated by the number of American planes attacking Yap, left them alone and took their frustration out on us, a safer target. They strafed us and then bombed us, forcing us to dive. One bullet hit the hull right above my head where I was sitting in the crew's mess just before we dove.

We spent a good deal of time circling Palau, so I'd like to get there and see what I missed 42 years ago. I don't know just what it'll cost to visit these islands, but I'm sure it won't be very expensive. Are there any of you who have some time and can afford a short island-hopping trip like that with me? It'd be a lot more fun with two or three fellow hams than alone. It'd be a trip you'd never forget.

Micronesian Airlines gets to all these islands, so it's not difficult to get around. Most of 'em have at least a small hotel, so there's a place to stay. I'll bet we can find some local hams who will be delighted to help make our visit fun. Heck, we might not even have to carry hundreds of pounds of ham gear and take the time and work to get it all set up.

Amateurs in rare spots are always delighted when someone comes in and works the pileups for them—as long as they handle the QSLs too and don't cause the local hams the trouble and expense of cleaning up after 'em with QSL cards. Many hams in rare spots do all they can to avoid the QSL chores brought on by the thousands of hams who have no interest in them personally, but just want a new country confirmation. It's a royal pain in the ass for most hams in rare spots.

QSL managers help some, but that doesn't get you out of pileups and breakers frantic to get your card. It's almost impossible to have a normal contact with anyone, a factor which often drives operators in rare countries off the air entirely. Imagine if all you could ever make were contest type contacts! Imagine if every time you tried to actually talk with someone you got breakers who were increasingly nasty about getting a contact before the band conditions changed. Is it any wonder ops in rare countries get fed up in short order? Perhaps you can understand why ops in rare spots are so anxious to have visitors come in and work the bands to take off some of the heat.

Of course, as DXers know, the heat doesn't stay off for long. We seem to be able to generate more DXers spontaneously, so no matter how worked out a rare country may be, a few months later there are pileups again.

Until you've worked the business end of the pileups you don't really get the excitement of amateur radio. Sure, it gets old after a while, as does almost any excitement, but for the short run there's little in amateur radio to compare with the kick of operating from some really wanted country. Heady stuff.

My first experience with this was back in 1958 when six of us went to Navassa Island and put KC4AF on the air. We operated around the clock for a few days and had the time of our lives. Half of the chaps on the trip smoked, so they're no longer alive. Navassa was a tiny, uninhabited island off the coast of Haiti—belonged to the U.S., hence the KC4 call.

We all drove to Miami, took our rigs, generators, antennas and towers on a cargo ship to Nassau in the Bahamas, where we hired a motor-sailer ship which took us down to Navassa. It was one hell of a trip down, with us going through the edges of a hurricane. Navassa has no beaches—the only way you can get on the island is by climbing up the sheer cliff using a hanging ladder put there for occasional Coast Guard visits. It's a trip of a lifetime.

One trip to Navassa is enough for even the most dedicated DXpedition fanatic—it's one of the tougher places to get to in the world. Naturally, I went there again in 1973 with another group

QSL OF THE MONTH

To enter your QSL, mail it in an envelope to *73*, WGE Center, 70 Rte. 202 N., Peterborough NH 03458, Attn: QSL of the Month. Winners receive a one-year subscription (or extension) to *73*. Entries not in envelopes cannot be accepted.

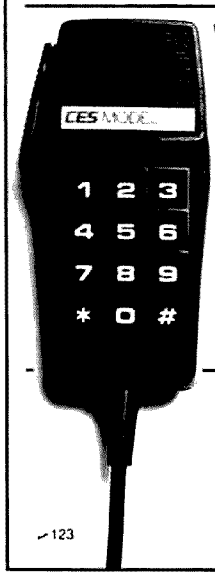
and operated as KC4DX. I'm a sucker for adventure.

Operating from the new Pacific republics won't be quite as adventurous as Navassa, but I know the pileups will be record breaking. If you don't know how to handle 'em when you go there, you'll be an expert when you get back. Perhaps I should give some lessons. I've operated from a lot of rare spots—let's see, some of the rarer places I've activated were Kenya, Lebanon, Syria, Iran, India, Nepal, New Caledonia, Fiji, Wake Island, Philippines, Sabah, Sarawak, Western Samoa, American Samoa, Tahiti, Jordan, Thailand, South Korea, Swaziland, and Lesotho.

If there are some of you readers interested in visiting the new republics and putting them on the air for a while, let me know and I'll start putting together a DXpedition. Of course, I suppose some group will want to grab "the glory" and go there first. How glory has any real meaning in the small world of amateur radio, I'm not sure. To me it's the fun of going there and working the pileups. I really don't care if I'm first or fifth, so if there are some fanatics to whom this is really important—

Would you buy a used Wouff-Hong from this man?



first I suggest investing in a psychological evaluation of your sanity. . . which I know you will fail. There's no glory in amateur radio, just fun to be had.

The hams who sit around anxiously waiting for emergencies so they will have a crack at becoming famous by winning an award for their emergency work have things all out of balance. We should set up to handle emergencies because we enjoy doing it. We should work DX because we enjoy it—and not be willing to kill in order to move up one line in a listing in *QST*. St. Peter does not read *QST*—I hope that doesn't shatter your whole world. I'd even suggest that God doesn't read *QST*, but I know a lot of DXers who place *QST* way above the Bible wouldn't believe me.

So, are you going to face up to your responsibilities as a ham? Are you going to stop taking all the time and start giving for a change? Isn't it time you started making amateur radio more fun for others instead of making so many other DXers miserable with your incessant breaking in and calling in pileups? You know as well as I that you are illegal when you're doing that. You know it's against the LAW to intentionally interfere with other radio signals—and that is precisely what you are doing in a pileup. Don't you try and weasel with that wide-eyed innocence of yours telling me you didn't know anyone else was on the frequency. You did so know and you maliciously stomped all of 'em. That's deliberate and malicious interference.

You say you haven't the time for a trip? Hogwash! Of course you have. You have the time to do anything you really want to. If you've gotten yourself tied to a job where you can't get away now and then when you want, you should start thinking in terms of going into business for yourself. Hey, you only get one run through this life—and the years are going by faster and faster. If you don't get horsed around to where you can get away

for a week or two to get to Palau or some place with me, it's time to start getting your . . . er . . . stuff together.

I guarantee you don't know many people (any, actually) who are busier than me. Yet I can get away when I make up my mind to do it. I manage to go on the two-week Asian electronic show tour every October. I get away for a few days of skiing every January (and you're welcome to join me if you've got an HT and the time). I get away for a skin diving trip in the summer. I also have been getting to a lot of hamfests and conventions—and still I've managed to run my businesses—perhaps not as well as I could if I didn't do anything else, but the trade-off is fine.

I tried to get you to come with me this October on a DXpedition to Korea, Taiwan, Hong Kong, Sabah, Brunei, and Sarawak. After writing about it for months I had maybe a half dozen hams who felt they could afford the time and money for the trip—not enough to make it feasible. That's pitiful. I should have had a hundred or more queued up wanting to go. I guarantee you that if I proposed anything like that in Japan I'd have a hundred—probably more like 500—anxious to go.

We're not going to get amateur radio back to life and fun unless we're all having fun. Right now the hobby is dying—which is no news flash. There are a number of things you can do to help—as I've written—like get on the air and work Novices—make hamming fun for them by giving them some entertaining contacts. Getting your ham club to sponsor a school radio club in your community is another big winner. Getting on the air and making life fun for other hams with your cheerful personality isn't going to hurt either. Let everyone know you're enjoying amateur radio.

Working DX is a whole lot of fun, so get yourself into gear—get out of your damned rut and hie off to some rare spot and generate some pileups to whip down. Take along packet gear, slow scan, and RTTY—make it even more exciting for these ops.

Now, are we going to the Pacific and have a ball or are you going to just sit there and grumble?

PICTURE THIS!

If you're looking for a way to get into business on the semi-cheap, I ran across a nice scam—making computer printout photos. It's not a new dodge, but this is the first system I've seen which spurts out full-color pictures (see my photo, page 12). They've had black and whites for around ten years now.

The first computer photo printing systems were quite expensive, requiring a minicomputer for power. They did a land office business. Then it got so you could do the same work with a microcomputer at a fraction of the investment, so systems proliferated, killing the market.

"There are hundreds of hams whose perspective is so incredibly distorted that they actually believe it makes a difference whether they've worked 320 or 321 countries."

Around three or four years ago I remember Tuft's Electronics using an Apple II at Dayton to print stuff on hats—that's where the hat you've seen me wearing on the cover and in subscription ads was made. They did T-shirts with the same system.

It's possible this business can be revived with color pictures. Like the black and white printouts, these can be imprinted on T-shirts . . . or whatever. It's too bad we don't use handkerchiefs any more—you could send one with your picture on it to your friends so they could wipe their nose on you. Maybe there's a market for photo toilet paper? I'll bet I could sell tons of Kaddafi's pictures this way. And never mind what picture would sell best at ARRL HQ.

At any rate, if you live where you think you might be able to keep something like this going—in a busy mall—at exhibitions—hamfests—the whole outfit costs about $15,000. That includes the Apple II, disk drive, color monitor, video camera, photoflash and parasol, color printer, control unit, and heated shirt press.

If business gets out of hand, the system is expandable to two printers, a tape storage system for the freeze-frame pictures, and so on.

This looks like a nice spare-time business. The operating expenses are minimal, so mostly you have to make enough to pay for your hardware investment. If you put $3,000 down and borrow $12,000 from the bank at 10% you've got an overhead of around $600 a month for two years to pay off the works. Thus, if you clear $3 per picture, including your time, you've got to sell about 200 pictures a month to break even. If you only work 20 evenings a month the first ten pictures a day will pay off the system . . . the rest is gravy.

Whoa! I'm not suggesting you rush out and buy a computerized color printing outfit and make a bundle, though that isn't a bad idea. I'm more pointing out that there are a thousand ways to make money if you keep your eyes open for 'em. Keep your imagination honed. I spotted this system at the Consumer Electronic Show in Chicago in June. Maybe, if it isn't too tough a trip for you, it would be worth your while to get to the next one in Las Vegas, January 8–11.

Right after CES I usually stop off in Colorado for a few days of skiing with a group of ham industry people . . . if you've got an HT and would like to, join us the 13–18. This January ham industry conference has been going on for over ten years now.

If you'd like more information on the computer color printing stuff, drop me a line and I'll point you in the right direction.

COUNTRY HEAVEN IN '87

One of the biggest beefs I get about the ARRL has to do with their autocratic decisions on what is or what is not a country for their DXCC award. I'm afraid I have a problem with getting uptight over this obviously major difficulty.

Yes, I know, there are hundreds of hams whose perspective is so incredibly distorted that they actually believe it makes a difference whether they've worked 320 or 321 countries. I've known fanatic DXers to spend a thousand dollars in order to make sure they could keep up with their brethern on the Honor Roll when they get a new one.

Indeed, one of the brighter DXpeditioners charged whatever the market would bear to provide contacts for the top guns on the Honor Roll. He bragged he was making over $50,000 a year—with no taxes since it was all in "donations" and there was no way for the IRS to find out how much he was making.

I remember when he signed a call of a brand new country—Spratly Island, as I recall—where he purposely couldn't hear the top guns who hadn't paid his demands, thereby shuffling the top end of the Honor Roll and generating enormous consternation. Some DXers called him solid for a week, 24-hours a day, without connecting. Later investigations seemed to put him as actually operating from northern Thailand, but the League accepted the Spratly QSLs anyway.

His best DXpedition was from Heard Island in the South Indian Ocean. It appears as if he actually operated this one from just north of Vancouver.

Hmmm, I digress—wonder how that happened? Oh, I was making a point about the cosmic uselessness of getting emotionally involved with DXCC and other such awards. If they're fun—fine. If you start finding you are hooked—are staying home from work to get a new country or some such nonsense, hey . . . this is a hobby! Fun, not desperation, is the name of the game.

Now, in order to make things even more fun, I've decided to solve once and for all the problem of deciding what is or what is not a country. I've figured out how to make this a non-problem. How would you like a country award where there are 396 countries? I'm not talking about my deciding what is or what is not a country—not even establishing a DX Country Committee with an Awards Chairman to flog. I'm talking 396 actual legitimate countries for you to chase.

It's this way. First we start with the 320 or so the ARRL accepts . . . and no rude remarks about them being tight-assed about accepting new countries. That's a fine start, but it leaves out a lot of countries which other International Amateur Radio Union (IARU) national amateur radio societies accept. I don't see why the League should have all the votes in the IARU on country counts.

So I set our Perry Donham KW1O loose on getting lists of accepted countries from all of the IARU member societies. These are all national amateur radio societies, so presumably each has the intelligence and the resources to know about such things. When we looked into it we found that the REF (France) had some territories which they accepted as countries,

LETTERS

Number 16 on your Feedback card

HAVE A NICE DAY

I must respond to the "Thumbs Down" letter by "Name withheld" in the October, 1986, issue. As soon as I read it, it hit me that people like this guy are a big reason that I am not a ham.

For the last 20 years I have been listening to the ham bands on my shortwave radio. When I was younger I found it very interesting to listen in on two old-timers talking about the good old days. Now that I am older I can go sit in any bar and listen to old-timers talking about how great it was to buy gas for 15¢ a gallon (they forget that they made $2 a day at the time).

In the last five years I have noticed that ham conversations are more like this:

Ham 1: "Gotta go, I'm at work now."

Ham 2: "Yea, Ham 1, you get to work so you can pay Social Security so I can get my check."

Ham 3: "Yep, we've got to get our check."

Ham 4: "73, Ham 1, I've got to scrub my dentures and then go to the doctor again for my bad back."

Then I read this letter in your magazine from some old coot who calls himself a dumb bastard. He says, "Do you really think a Novice or pre-Novice could understand one single word?"

This guy is obviously in the denture crowd. I have friends I have been trying to talk into getting their ham ticket for years. Almost every time I bring up the subject of ham radio, these people don't want to know anything about it or they ask, "Is that like CB?" They ask why you should talk around the world on a noisy radio when a phone call will get through every time. Good question. Why would you?

Nobody wants to learn the Morse code; my computer friends laugh when I suggest it. Do the hams out there really think anybody wants to build crystal radio sets and sit around drinking coffee all day, waiting for some guy to come on from DX-land?

People have money to spend; not everyone is on a fixed income like you hams. This is what people outside ham radio are planning: We are going to take away your bands. Not just 220, but any band we want. We are going to use the ham bands mainly for computer use and for personal communications. Who is going to stop us? Certainly not a lot of fat old farts with high blood pressure who still think that there is such a thing as a pre-Novice, implying that you don't know anything about electronics if you're not a ham.

What's to stop me from buying a radio and transmitting with my computer right now? I can say with confidence that 99% of you hams pose no threat to us non-hams who ARE going to take away your bands and put them to good use. We will let you bitch and moan about your problems over the CB.

You hams are a disgrace to the human race. I have gone to many hamfests around the state and can honestly say that I have never seen a bunch of bigger slobs anywhere. Most of you are fat, smoke cigarettes, use no deodorant, and are just a plain bunch of nerds.

I am also into motorcycles; at swap meets for bikes we have fun. There are lots of good-looking women into bikes. How many foxes were at your last hamfest?

We non-hams are not going to sit back and watch a bunch of fat old nerds sit back and hide from life in their radio rooms much longer. We were willing to give the no-code license a try, but now that's out and we're mad and tired of waiting around for you guys to die off.

We have the money, the vast numbers of people, our health, and energy to devote to the cause of using the airwaves for the public good.

This is America, where the majority rules! Hams are old news and have stayed on the air too long, cluttering up useful frequency space that can and will be put to good use.

Mad in Madison WI

If you're going to hamfests solely to pick up "foxes," you're definitely going to be disappointed. Try a personal ad: "Healthy, prosperous SWM with lots of energy seeks fox for public good." That will take care of your fox problem.

Why don't you pick a callsign and get on the air as a pirate. It's no big deal—quite a few folks I know started their ham career with a bogus call (including W2NSD). I used to bootleg as K9TNV very successfully, except for the time I ended up in the Canadian phone band. You can have great fun if you choose a call from a rare DX spot and run about 5 Watts into a dipole. You could even have some QSL cards printed up (see our ad on page 65).

It's obvious that ham radio scares you—otherwise you'd be on the air instead of writing juvenile letters like this one. Or maybe it's hams that scare you—are you afraid that if you're found out they'll make you stop bathing? Be sure to write when you get your computer hooked up. . . —KW1O.

LANGUAGE BARRIER

With regard to KW1O's response to the criticism of the August packet issue ("Trust me, they understand every word"): I was recently showing my packet station to a young man who now runs a telephone BBS. He seemed to understand 1200 baud, checksum, RS-232 interface, and serial port and appeared interested in learning more about packet. So I let him make a connection on packet. The ham on the other end started using terms like "FB OM" and "What is UR QTH TX FR QSO 73 CUL." My young friend was now totally confused and asked, "Why don't hams speak English?"

Earl Morris N8ERO
Midland MI

I've often asked that question myself! Using CW abbreviations on RTTY and packet is the mark of a poor operator. The crazy thing is that it ends up taking longer to get a message across; by the time you've figured out what the abbreviation is and found the letters on the keyboard, you could've typed the whole word in.

Q signals I can tolerate, since they have become words in our vocabulary (yes, you can use them on phone, too). But if I hear you using "MX ES HNY!" on packet when you mean "Merry Christmas and Happy New Year," I will personally come and stick a pin in your coax.

You should, however, continue to use "73" whenever possible during your conversations. —KW1O.

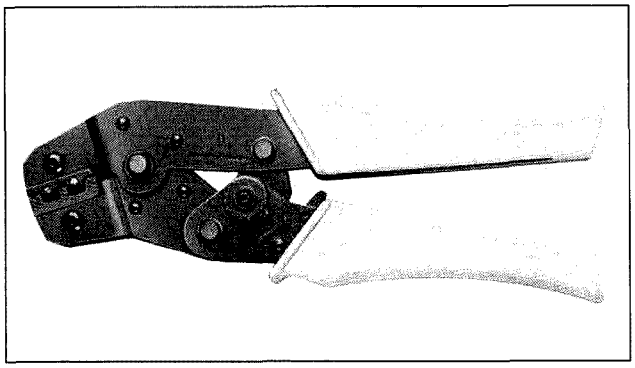
MUSEUM OR MORGUE?

I'm certain that you didn't miss the editorials in *CO* and *Ham Radio* blasting the ARRL about their "monument to the past." The League is spending several million dollars on it, plus diverting manpower to a project that is ludicrous in the light of a decreasing ham population.

Maybe the ARRL does see the handwriting on the wall and wants to get the project completed before amateur radio dies and it can be buried in a mausoleum. Frankly, I had expected to see about six pages in Never Say Die on this subject, but I guess you have selected a more appropriate time for an exclusive issue.

Your August issue on packet was the best yet—and I feel there is a need to devote more space to packet projects. Amateurs are buying TNCs fast and furious and they are generating lots of questions on operation that are not answered in NK6K's column.

Until I move back to New Hampshire—keep fighting.



John J. Mitchell W1GSM
South Bend IN

Quoting from "Throw Yourself Into The Volcano" in November's Never Say Die: "I'll bet you thought I was going to be critical of the League for putting so much into a museum instead of investing it in promoting the growth of the hobby. Nope, not me. I think they see amateur radio about to crash in the near future, so the best possible investment will be a museum so later generations will be able to know there once was something called amateur radio. Good move. I've got some first-class stuff I might donate. . . been wondering what to do with it." —Eds.

Nice idea, lousy timing. You have to wonder what's going on at Board meetings; do they even consider what the implications of their actions are? Or do the Directors just vote for something because it sounds neat, or because their friend is backing it? It certainly seems that way this time. Perhaps there should be a mandatory cooling-off period, say 30 days, between the introduction of a proposal and the vote on it. That should be plenty of time for the Directors to come up with an original thought or two. . . —KW1O.

NEW PRODUCTS

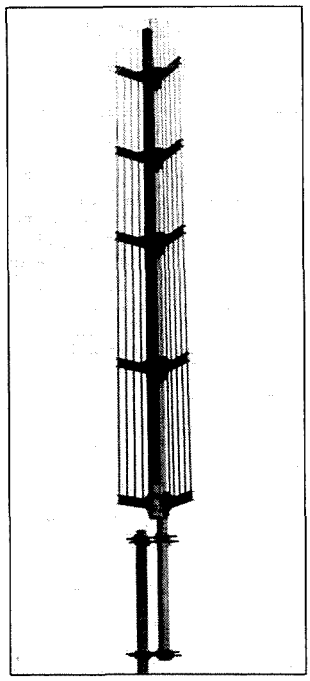
Number 19 on your Feedback card

Xcelite's one-handed crimping tool.

XCELITE CRIMPER

Crimping tools designed for one-handed operation are available from the Xcelite division of the Cooper Group. The force needed for crimping is 36 pounds, compared to the 70 pounds required in most other tools. The crimpers are made of high-quality steel and they have been life tested to 50,000 operations. The tools feature a ratchet which guarantees consistent crimping force and a one-finger release mechanism.

For more information, please check Reader Service number 201.



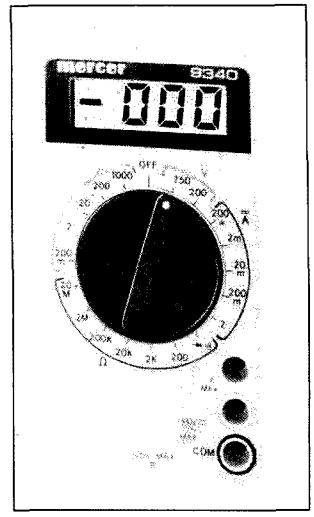
ESP MODEM PROTECTION

Electronic Specialists has added modem protection to their Kleen Line series of transient suppressors. The PDS-11 uses gas discharge tubes to suppress telephone line spikes caused by lightning, electrical noise, or central switching systems. An isolated ground is provided to protect equipment even further. The PDS-11 is set up for a standard 4-pin modular telephone connector; suppression is on the red and green line, with the yellow and black line run straight through.

For complete details on the Kleen Line series, please check Reader Service number 202.

CELLULAR SECTOR ANTENNAS

Two new 800-MHz 60° sector antennas designed for both wireline and non-wireline systems are now available from Antenna Specialists. The 17-dB gain antennas provide a 55-MHz bandwidth, allowing full duplex operation in sector-to-sector cell sites. The antennas are ruggedly constructed with extensive welding of connections to minimize noise and provide maximum reliability. Rated at 500 Watts, the antennas exhibit a 25-dB front-to-back ratio with a vertical beamwidth of 7.5°. Model ASPE963 covers 825–880 MHz, and model ASPF963 covers 835–890 MHz.

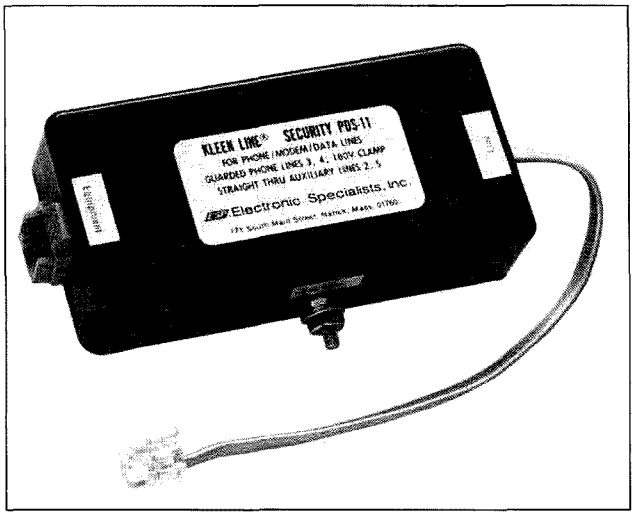


Antenna Specialists' ASPE963 800-MHz antenna.

For detailed specifications, check Reader Service number 203.

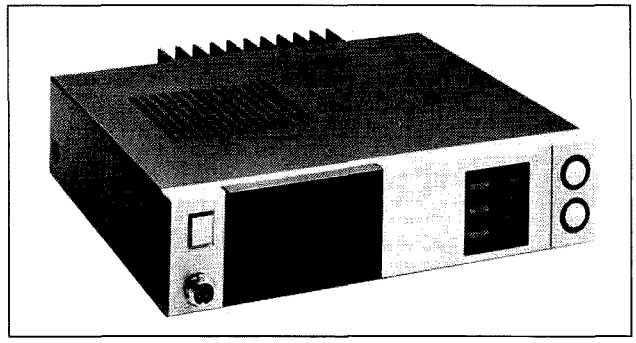
MERCER MINI DMM

Mercer Electronics, a division of Simpson Electric, has announced a pocket digital multimeter that weighs less than half a pound. The model 9340 ($44) is housed in a high-impact, high-visibility yellow case and measures up to 1,000 V dc (five ranges), 750 V ac (two ranges), 20 megohms (six ranges), and 2 Amps dc (five ranges). An audible continuity checker and a diode-test position are also included. The 9340 comes with a 9-V battery, color-coded test leads, and an operator's manual.



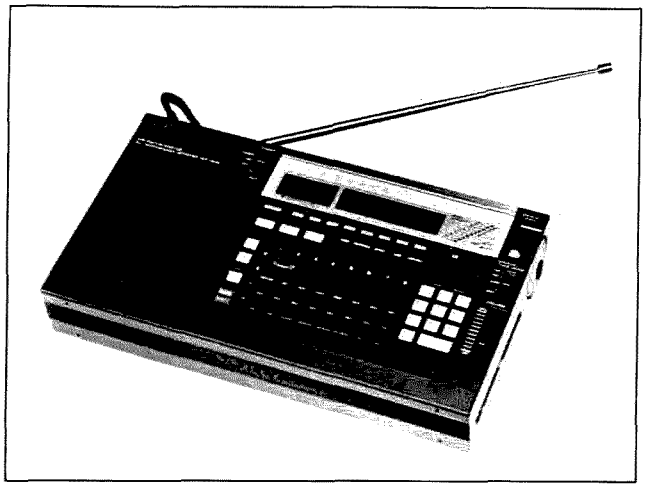
Mercer's model 9340 pocket DMM.

For more information about the model 9340 pocket DMM, check Reader Service number 210.



STANDARD RP70K

Standard Communications is now marketing an 800-MHz version of their RP70 desktop repeater/base station. The RP70K features full-duplex operation in either base station or repeater mode with power output adjustable from 5 to 15 Watts. Up to two CTCSS encoder/decoders may be added as options, providing the user with two private channels. Other features include a time-out timer, phone patch capability, and a backup 13.8-V-dc battery with automatic power-failure switch-over.



For more information, please check Reader Service number 205.

Kleen Line modem protection from ESP.

Standard's RP70K base station/repeater.

Sony's ICF-2010 general-coverage receiver.

SONY ICF-2010

Sony's feature-packed ICF-2010 PLL synthesized receiver includes dual PLL quartz frequency synthesis, synchronous detection circuitry, a switchable i-f bandwidth, 32 memories with memory scanning, automatic scan tuning, direct keyboard entry, and a built-in quartz clock with a timer. The ICF-2010 covers 150 kHz to 29.999 MHz (AM), 76–108 MHz (FM), and 116–136 MHz (air band).

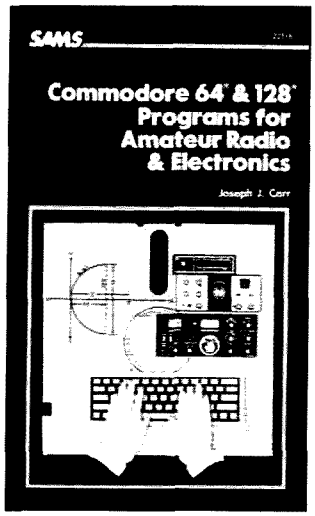
For complete details, check Reader Service number 206.

TRIO CODE-PRO

PC Code-Pro and Mac Code-Pro are two new products available from Trio Technology. The programs help you to learn Morse code or improve your code proficiency. Code is sent in continuous or five-character random groups from 5 to 40 wpm with selectable character spacing. PC Code-Pro runs on any IBM PC-compatible, and Mac Code-Pro is the Macintosh version.

For more details, please check Reader Service number 204.

SAMS HAM SOFTWARE



Howard Sams books has published *Commodore 64® & 128® Programs for Amateur Radio & Electronics* by Joseph Carr. The book includes 42 programs covering antenna calculations, swr, transmission lines, impedance-matching networks, dish antennas, capacitors, resistors, and inductors in series and parallel, RLC networks, and operational amplifier circuits. A diskette is available from the author for those who don't want to type it all in.

For more details, please check Reader Service number 211.

COMMUNICATIONS SATELLITES

The expanded second edition of *Communications Satellites* is now available from Grove Enterprises. Chapters cover spy and surveillance satellites, U.S. and Soviet manned space missions, military tactical and scientific satellites, oceanographic and weather orbiters, deep space probes, navigational and communication satellites, and private and direct broadcast satellites. Also covered are international satellites, band plans, transponder identification, and a history of satellite development.

For more information on this new edition, check Reader Service number 209.

Commodore programs from Sams.

The QSYer from Stone Mountain Engineering.

FT-757GX QSYer

Stone Mountain Engineering has announced the 757 QSYer, an accessory for the Yaesu FT-757GX which allows direct keypad entry of frequencies anywhere in the transceiver's range. The QSYer is a tiny computer terminal that interfaces directly with the 757's rear-panel data port; the QSYer draws power from the 757's accessory jack.

For more information, please check Reader Service number 208.

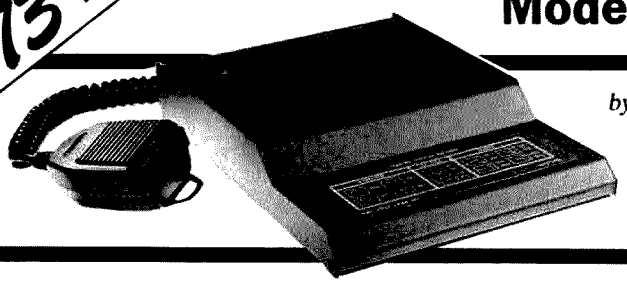
WORLDWIDE AIR TRAFFIC GUIDE

Cambridge Airadio has introduced a directory of HF air traffic control frequencies in the 2–22-MHz range. Cross-referenced lists include over 200 cities worldwide plus weather and airline company channels.

For more information, check Reader Service number 212.

COMMANDER II VHF AMP

The Commander II VHF amplifier from CCIE Manufacturing uses a 3CX800A7 for 650 Watts out with only 15 Watts of drive. Stripline circuits are employed on the input for maximum efficiency. The amp comes with a 155/240-V-ac power supply and weighs only 55 pounds. Precision ball drives with a 6:1 turn ratio are used on all tuning controls.



For complete details, check Reader Service number 207.

73 Review

Digital Voice Keyer Model DVK-100

by Jeff DeTray WB8BTH

Nel-Tech Labs, Inc.
28 Devonshire Lane
Londonderry NH 03053
Price class: $349

Number 9 on your Feedback card

It's the 40th hour of the *CQ* World Wide Phone DX Contest. By the best estimate, you've already called "CQ Contest" at least 5,000 times (no kidding!). And since the log already shows 1,000 contacts, chalk up another 1,000 deliveries of the contest exchange, "five-nine, oh-five." Frankly, the ol' voice has just about had it, but there are still 8 HOURS to go! As your attention begins to wander, it wanders to the phone contester's eternal favorite fantasy: When will someone invent a device that does for phone contesting what the memory keyer does for CW? Tape loops are fine, but contesters want the real thing, a true voice keyer. Enter the Nel-Tech Labs DVK-100.

Voice Keyer Basics

The DVK-100 is a Digital Voice Keyer. It records and plays back spoken messages in much the same way that a CW memory keyer handles messages in Morse code.

Messages are recorded or changed by putting the DVK-100 into the record mode, selecting a message number, and speaking the new message into the station microphone. The keyer records the message in the speaker's own voice by digitizing and storing it in random access memory (RAM) inside the keyer. Since the stored message is a digitized representation of the speaker's own voice, it is, when played back, nearly indistinguishable from the original.

Features

With the DVK-100, you can record four different voice messages, then replay any of the four at the touch of a button. While recording, the keyer samples the speaker's voice 32,000 times per second and stores a digital representation of each sample in RAM. All those samples eat up memory in a hurry, and it takes 128K of RAM to store 32 seconds of speech, divided among four messages. Frequency response of the DVK-100 is 300 to 3,000 Hz.

The maximum length of the four messages varies. There is one 16-second message, one of eight seconds duration, and a pair of four-second shorties. These seemingly brief messages are plenty long enough for most contest purposes. For instance, four seconds is about right for recording a contest exchange, such as the aforementioned "five-nine, oh-five," a couple of times. Your callsign will probably fit twice in four seconds, producing a message that is useful when trying to break a pileup. A short, contest-style CQ fits nicely in the eight-second slot, while the 16-second message is appropriate for long CQs, the kind you might use when contest rates are low and shorter calls are ineffective.

The microphone audio passes through the DVK-100 circuitry at all times. This means you can record while transmitting, then immediately play back what you've just said. It also means that if the keyer is turned off, the mike becomes inoperative. The keyer works equally well with dynamic and electret microphones.

Built into the DVK-100 is an audio compressor designed to increase the average audio level going to the transceiver. The processor may be selected at any time for compressing "live" audio from the microphone. To use the processor for recorded messages, it must be selected at the time the message is recorded. If you record a message without compression and decide later you want compression on that message, it must be re-recorded (a 30-second job). Since recording is so easy, you'll want to experiment.

For those of you who want to play astronaut, you can select a NASA-like "beep" to be inserted at the end of each recorded message. I'm not enamored with end-of-transmission beeps, and this one, at 0.25 seconds duration, is too long anyway.

Nuts and Bolts

The DVK-100 is a compact unit housed in a metal enclosure measuring 1.65" high, 7" wide, and 10.6" deep. Control of the keyer is by way of a 10-key membrane keyboard. In addition to four message keys with associated LED indicators, there are keys and LEDs for play/record, operate/program, hi/lo monitor level, plus on/off controls for the speech compressor, monitor speaker (user supplied), and end-of-transmission tone.

The rear panel features five-pin DIN sockets for connecting the DVK-100 to the station mike and transceiver. Jacks for power (10 V ac supplied by a wall-plug transformer) and for an 8-Ohm monitor speaker are also provided. Since the microphone push-to-talk (PTT) line is controlled by the DVK-100, a switch is provided to select either positive or negative PTT keying. The keyer works fine with VOX as well. Finally, Nel-Tech includes an adjustment to match the audio output level of the keyer to the requirements of your transceiver. DIN plugs are supplied to match the sockets on the keyer, but you are responsible for wiring up a short cable to connect the DVK-100 to your rig and for putting one of the DIN plugs on your microphone. The manual gives wiring instructions for most popular transceivers. Nel-Tech plans to offer cables already assembled as well.

As is so often the case with electronic products today, the manual that accompanies the DVK-100 is disappointing. For instance, it contains no discussion about such basic topics as setting the output level of the keyer or how to use the built-in audio compressor to maximum advantage in conjunction with your rig's speech processor. No schematic is supplied, either. While Nel-Tech should not be required to reveal all its secrets, buyers of accessories in this price range have every right to expect more complete documentation. Aside from the interconnection information, the manual really doesn't have much to offer.

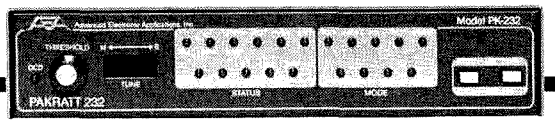
On the Air

It works! That's the bottom line. In evaluating the DVK-100, I conducted numerous 15- and 20-meter QSOs in which I asked unsuspecting hams to help me with a "microphone test." My victims were asked to listen to three transmissions and to pick the one that sounded different from the other two. I then spoke the same short message three times, one of which was the DVK-100 doing the talking.

Approximately 25% of the listeners could detect no difference in the three transmissions. Some even apologized for their inability to say which "microphone" sounded better than the others. Of those who heard a difference, about half picked the recorded message as the one that was different. Nearly all listeners said the differences were barely discernible. The quieter the band, the more likely the recorded version would be identified.

First use of the DVK-100 during the heat of battle was in the 1986 WAE Phone Contest. I used the keyer to call CQ, break pileups, and even to give my exchange. While you won't find WB8BTH listed among the contest winners (little items like antennas and amplifiers are still necessary), the DVK-100 definitely pulled its weight. The prospect of a 48-hour phone contest no longer seems as daunting.

Conclusions



The DVK-100 represents good value. In its intended market of phone contesters, it is currently the only game in town. At present, its applications beyond the contest and DX communities are few, but you can be sure some creative hams will devise new uses for the unit. How about a poor man's voice-messaging system for repeaters? It would certainly be less expensive than existing alternatives.

For phone contesters, the DVK-100 is the solution to a long-standing problem. To arrive at the end of a long phone contest far less fatigued and with one's voice still intact is reason enough for many serious contesters to acquire the Digital Voice Keyer. The keyer works just as you would expect, given experience with CW keyers, and installation requires only wiring up a couple of connectors. I liked the DVK-100. It's a winner. AEA PK-232 PAKRATT

by Perry Donham KW1O

Advanced Electronic Applications, Inc.
PO Box C-2160
Lynnwood WA 98036
Price class: $320

Number 10 on your Feedback card

Two years ago, when AEA came out with the PK-64 PAKRATT™ for the Commodore computer, many of us began to wonder when we'd see a PAKRATT for a generic machine. I think there was quite a bit of envy, too, as the non-C-64 owners saw how much fun it was to have a complete station controller run from the keyboard. Finally, there's some relief. AEA's PK-232 is designed to interface with any computer having an RS-232 port. And, maybe to make up for the long wait, the PK-232 is a classier unit.

The PAKRATT concept is this: AEA decided to put all of ham radio's digital operating modes into one station controller. The PK-232 will run Morse, Baudot RTTY, ASCII, AMTOR, and packet; all modes are selectable from the keyboard. All you have to do is plug a computer into the 232, run a cable over to your rig, and you're on the air!

Front Panel

The first thing that you'll notice about the PK-232 is the front panel and its twenty LEDs. The display is grouped into two sections: STATUS and MODE. Everything that you need to know about your operation is right here. MODE LEDs show not only the five basic modes, but also the "sub-mode" (FEC, ARQ, or Listen) on AMTOR. STATUS LEDs keep you in touch with what your transmitter is doing, what state the PK-232 is in, whether or not you're connected to another station, and so on. In a glance you can see exactly what's going on in the shack.

Two rigs can be attached to the PK-232; the RADIO 1/RADIO 2 switch selects which of them is active. Wiring in both a VHF and an HF transceiver gives you great flexibility of choice; the VHF and WIDESHIFT commands let you pick the appropriate tone pairs for operation on HF or VHF.

A ten-segment LED tuning display makes it very easy to net stations in on RTTY. The display is like a tiny spectrum analyzer which lets you look at the mark and space frequencies of the RTTY signal—with a little practice you can jump right on top of a station and even tell what shift is being used. For the purist, an oscilloscope output is provided on the rear panel.

Modes

The PK-232 handles just about every digital mode available to amateur radio operators. Modes are selected from the keyboard; it takes only a few keystrokes to jump from one to another. Each mode defines special keys to perform certain functions—you can turn your transmitter on and off with Control-X and Control-D, for example. The software folks at AEA spent a little time thinking about the codes to use, and as a result you'll find yourself quickly remembering which letters do what.

- **RTTY**—Typing "BA" from command mode will give you a full RTTY system. The unit will handle Baudot code at five standard speeds: 45, 50, 57, 75, and 100 baud (60, 66, 75, 100, and 132 wpm), selected by the RBAUD command. One blessing is the unshift-on-space feature which forces a switch to letters when a space is received. This comes in especially handy if you're copying things like news reports that have times and dates in them on a less-than-perfect channel. Sometimes the machine will read the shift to numbers but miss the shift back to letters. Without UOS you can end up with a few yards of nothing but numbers on your printout.

Another neat feature is the CCIT command which automatically translates characters into the International Telegraph Alphabet Number 2 used by many DX stations. You can type away and not have to worry about whether what you send as English comes out looking like Serbo-Croatian on the other end.

The PK-232 treats ASCII as a separate mode. Speeds supported are 45, 50, 57, 75, 100, 110, 150, 200, and 300 baud.

- **AMTOR**—This little-understood mode should gain some popularity with the introduction of the PK-232, since the PAKRATT makes it so easy to use. It's a bit complicated at first (there are a lot of obscure names for the different phases of operation), but the AEA manual leads you through an AMTOR QSO step by step, down to telling you which keys to press and when to press them. I think that part of the challenge of AMTOR is just figuring out how to talk with someone!
- **Morse**—The PK-232 deals very well with Morse sent from 5 to 99 wpm. The manual warns you not to expect miracles when trying to copy a poor fist, but I found the decoding algorithm to be pretty forgiving. There's a feature that sends BTs as filler characters, which I found a little annoying. I've always considered Morse keyboards to be a little silly, and this one is no different, but I must say that I was impressed by the 232's ease of use. If you're into CW keyboards, you'll definitely like this one.
- **Packet**—I have to admit that I consider the PK-232 to be a TNC that happens to have RTTY, AMTOR, and CW stuck in on the side. The 232 is a complete AX.25 level 2 TNC, and you can pick either version 1.0 or version 2.0. Up to ten multiple connections are available for those who tend to be slightly schizophrenic.

One of the best features is a complete set of MONITOR commands which let you keep track of who's on the channel, what path they're using, and what time they're on (using the built-in clock). You can also filter out stations that you'd rather not see on the screen, such as crazies who beacon every 10 seconds or BBSs spewing out last week's propagation bulletin. Speaking of beacons, the PK-232 will let you know if it thinks you're beaconing too often! (I think that it should display the "beaconing too often" message any time a beacon is turned on.)

You can switch very quickly from VHF to HF packet just by hitting the RADIO 1/RADIO 2 button and selecting the appropriate tone pair; it takes about 10 seconds.

Overall

I was impressed with the PK-232. As I mentioned, I would buy it primarily as a TNC and justify the added expense by using the other modes now and then. You could, I suppose, buy it as a RTTY TU and use it on packet and CW now and then. The big selling point is that you get all five modes right at your fingertips out of one small box.

The unit is built with the usual AEA attention to quality and I expect it to run practically forever. I didn't have any trouble at all with interference to or from the computer.

If you have any interest at all in using digital modes on ham radio, I would strongly recommend buying the PK-232. Reader Service number 214.■

Heathkit HS-148 Compact PC

by Perry Donham KW1O

Heath Company
Dept. 150-815
Benton Harbor MI 49022
Price class: $900

Number 11 on your Feedback card

You can't go to a hamfest anymore without seeing at least two companies selling IBM PC-compatibles. This year's Dayton Hamvention had six! Hams are buying up these units faster than surplus HTs; I have the feeling that the days of the VIC-20 and C-64 are numbered.

The reason that these units are selling in such volume is the price/performance ratio. As the price of clones falls, it gets to a point where it's just silly not to buy one. Why spend several hundred dollars on a C-64 with a monitor and drives when for a few hundred more you can pick up a computer that's IBM-compatible and comes with 360K drives and 256K of RAM?

The real question, then, is where to buy your

computer. I spent several months wandering the hamfests, observing seedy-looking salesman handing out mimeographed information sheets. The prices were fine, but somehow I didn't believe that I would get much support if I ever needed help. Then one day I wandered into the Heath booth.

Heath's HS-148

Heathkit sells several PC-compatibles. I chose one on the low end of the scale since I really didn't need coprocessors, multitasking, and networking. The HS-148 kit seemed to perfectly fill my requirements for a low-cost, multipurpose machine that would let me do word processing, programming (in languages other than Basic), and would have the ability to control the shack.

The basic HS-148 comes standard with 256K of RAM (expandable to 640K), one 360K half-height disk drive, a monochrome monitor, and the MS-DOS operating system. The keyboard is full-size (including 10 function keys) and has an excellent feel. Both composite monochrome and RGB video are supported, and one parallel and one serial port are brought to the back panel.

The processor is an 8088 16-bit CPU running at 4.7 or 8 MHz. A front-panel switch lets you select the clock speed; so far I've toggled to 4.7 MHz only once, to see how much slower things ran (noticeably slower). There's a spot for an 8087 numeric coprocessor, and Heath offers the chip as an option for $285. I can't think of many applications that need the extra number-crunching capability, especially in a home environment.

All of the cabling for drive B is in the kit. Heath's second drive retails for $200; I suggest buying one mail-order for half the price (Jameco has one for $109). As long as the drive is PC-compatible you should have no trouble—just bolt it down and plug it in. Wherever you get it, it's well worth the extra price for the second drive.

There are no expansion slots on this machine. You've got the built-in parallel and serial ports to work with, but if you need more than that you'll have to buy the ZA-141 Daughter Board for $99. This unit is installed above the I/O board and allows the use of one additional plug-in board (a standard PC has seven expansion slots). I have a couple of applications that require joysticks, so I'll probably end up using the ZA-141 in conjunction with the PCS-110 Game Port ($69.95).

Construction

The computer came in two giant boxes. It took about ten minutes to pull everything out, and only another hour to completely assemble the system. There is no soldering going on here—you just bolt things down and plug them in. I knew it would go quickly, but I was still surprised when I looked at my watch! The construction manual is very thin; about half of it deals with installing disk drives.

The computer comes in two parts, a CPU section and an input/output section, which are connected to each other with a 60-conductor cable. Sockets for two additional banks of RAM are provided on the CPU board. Expanding memory to 640K is extremely simple—you just plug the memory in and set a few DIP switches to tell the processor how much RAM to expect. It takes about three minutes. I would suggest not buying extra memory from Heath. I hate to keep knocking Heath add-ons, but they tend to be a bit pricey (their 256K RAM sets are $80, while you can pick up the same parts at Jameco for about $30). If you're not comfortable mucking around inside a computer, spend the extra bucks and get Heath's excellent instructions and support.

Operation

Once things were all together, I raced through the diagnostics and grabbed MicroSoft's Flight Simulator off the shelf. I figured that if the HS-148 could run this, it could run anything! I managed to fly right into the Statue of Liberty with no problem.Some of the packages I've run are WordStar, SideKick, CrossTalk XVI, and the Perfect series of integrated software, all with no hitches.

I'm Happy

I've been extremely pleased with the HS-148 computer. Assembly was a snap (literally!), and the thing has run flawlessly from the first time I powered it up. It's faster than my IBM PC, and smaller and lighter, too. I like the keyboard a lot (better, I think, than the IBM's and infinitely better than Leading Edge's), and the display is sharp. It runs every scrap of software I've fed it without blinking.

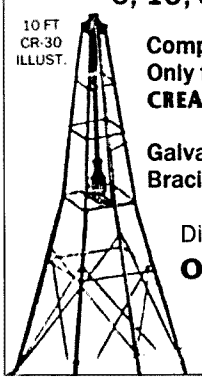
The documentation is about as heavy as the computer and *very* complete. You also get a set of docs for MS-DOS. There's more stuff in these books than you'll ever want to know.

Is it worth the extra hundred or so dollars to buy a clone from Heath? I think it is. First, I trust Heath's quality control. I've built several Heath kits and have had no trouble whatsoever with them. Second, I know that if something goes wrong, I can call Heath on the phone and they'll help me. They have people whose job it is to do that. Finally, I can join Heath's User's Group and get access to cheap software!

Heath's Christmas catalog has the HS-148 and all of the accessories in it; you can get a copy by writing to Heath Company, Dept. 150-815, Benton Harbor MI 49022, or check Reader Service number 215.■

ALL BAND DIPOLE TRAP ANTENNAS!

PRETUNED - ASSEMBLED ONLY ONE NEAT SMALL ANTENNA FOR ALL BANDS! EXCELLENT FOR APARTMENTS! IMPROVED DESIGN! FOR ALL MAKES AMATEUR TRANSCEIVERS! GUARANTEED FOR 2000 WATTS SSB INPUT FOR NOVICE AND ALL CLASS AMATEURS! CW - AM - FM



COMPLETE with 90 ft. RG58U-52 ohm feedline, and PL259 connector, insulators, 30 ft. 300 lb. test dacron end supports, center connector with built in lightning arrester and static discharge, sealed, weatherproof, traps. 1"X5" wt 3 oz. Low SWR over all bands. -Tuners usually NOT NEEDED! Can be used as inverted V's - slopers - in attics, on building tops or narrow lots. WORKS ON NEW WARC BANDS! The ONLY ANTENNA YOU WILL EVER NEED FOR ALL BANDS! NO BALUNS NEEDED!

Make The Switch!

WARC the world with your boat anchor — add new positions to your old bandswitch.

Number 1 on your Feedback card

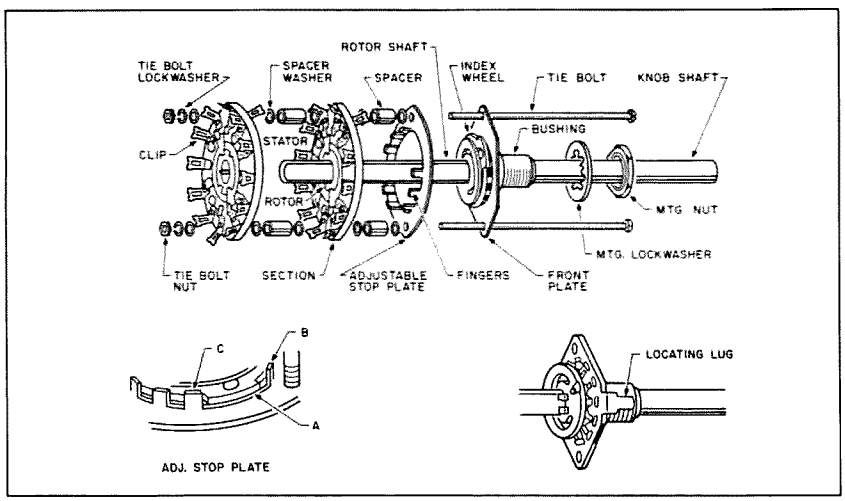

Fig. 1. Exploded view of the Centralab PA-1000 and PA-2000 rotary switch.

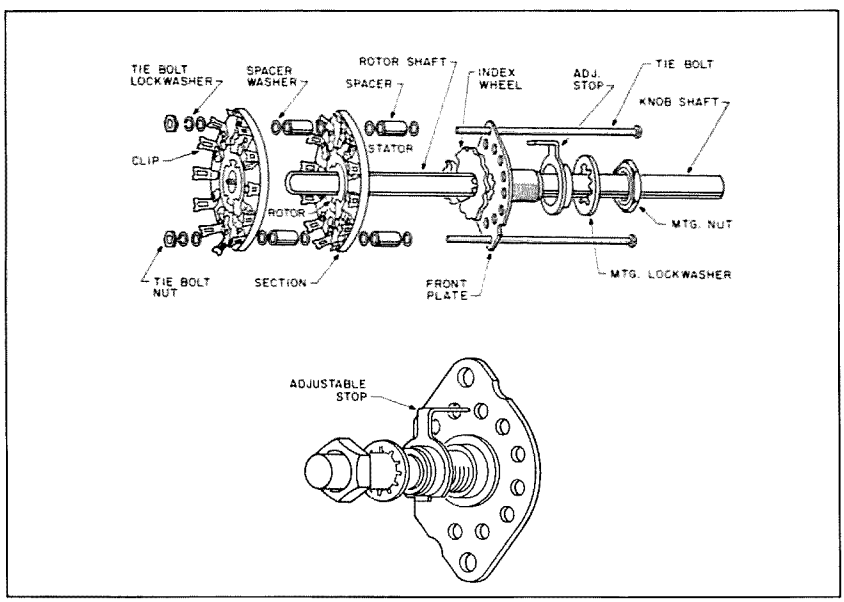

Fig. 2. Exploded view of the 1400- and 2500-series standard rotary switch.

With the introduction of new amateur bands in the HF spectrum, many transmitters, vfo's, and receivers have been rendered obsolete or at least out of place. However, much can be done if you're willing to adapt existing equipment to the new bands. It sure would be nice to expand the range of a vfo with an extra tuned circuit or add a new band to a ham-band-only receiver.

Older equipment usually has multi-position rotary switches which can be rebuilt to make

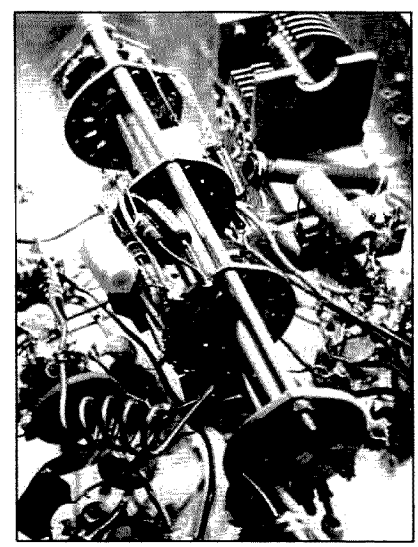

Photo A. Typical medium-power transmitter bandswitch (Allied T-150A) with four gangs or index assemblies (or wafers). The closest gang in the photo is made out of porcelain for the final amplifier. You will need at least a 3/16" screw here. The other thinner phenolic wafers behind this will accept a 1/8" screw. Before obtaining the small 0-80 hardware, check for proper minimum screw length in your own equipment. In addition, perhaps you can use the larger 1-72 or even 2-56 hardware if the wafers and corresponding holes are bigger. Also, the still smaller 00-90 and 000-120 are available. Obtain a catalog!

room for additional LC circuitry. For instance, an 80- through 6-meter medium-power transmitter uses six band positions, but has 11 potential positions in the bandswitch. This article involves the use of these extra positions.

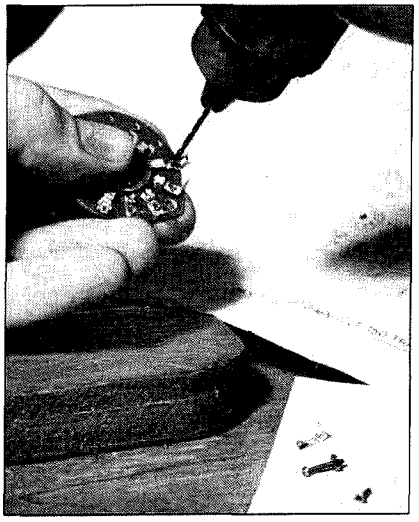

Photo B. The drilling out of slide-contact teeth. Please use a heavy glove when doing this and don't drill toward yourself. Lean the part lightly against a block of wood while drilling. If the wafer jams, let it slip from your heavily gloved fingers and unjam it manually. Believe it or not, I broke a small hobby drill trying to do this. Try not to break a wafer!

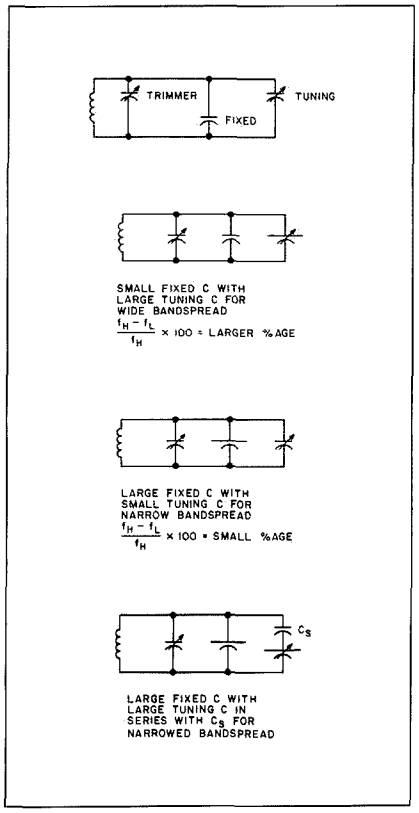

Fig. 3. Methods of varying band-spread.

The rebuilding of the bandswitch by the addition and movement of contact teeth can start with the removal of parts from a junkbox rotary switch of the same manufacturer and type as the bandswitch. Carefully match the make and physical size—bring the junkbox switch to actually touch and match the bandswitch if possible. There are very small and subtle differences among rotary switches, so you must make sure that your switches are mechanically compatible. When you're sure, use a small drill to remove the miniature rivet so you can salvage the slide-contact teeth (see Photo B). These teeth are then fitted into the unused holes of the index assemblies (or "wafers") on the bandswitch being converted.

Additionally, you probably need to shift some teeth on the bandswitch (see Photo C) by drilling out inappropriate tooth fasteners and shifting around the loose teeth to appropriate locations. (Do I sound like a dentist?) To position the drill at a good angle, the bandswitching assembly will have to be loosened from its position and, in case of multiple sections, removed. See if you can get away with not having to remove the whole

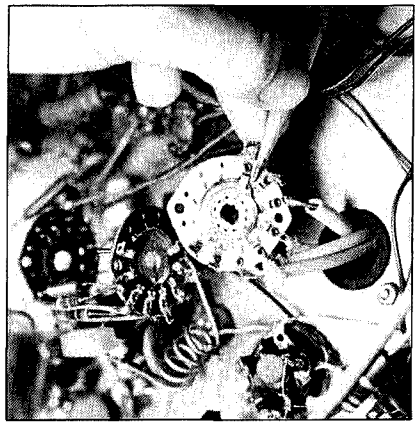

Photo C. Bandswitching wafer from an Allied T-150A transmitter (80 through 6 meters) with added band position. Long-toothed contact at 7 o'clock had just been shifted one stop clockwise and resulting space replaced with a short-toothed contact. Notice the two small screw heads holding their respective contacts. Also notice how this index assembly and the ones behind it are hanging on by their leads—switching shaft and pillars are removed. Back in it all goes.

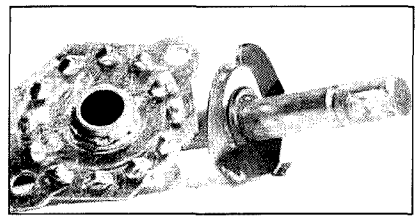

Photo D. Custom stop plate on T-150A bandswitch (originally made for six positions) showing former stop at 8 o'clock after having been banged in and flattened with a nail-set tool. The other stop at 2 o'clock was left alone (look carefully). "Index wheel" sits on shaft and is disassembled from the stop plate in this photo. Single tab on index wheel hits stop in assembled position. Note that this former 6-position stop is now an 11-position stop, as the index wheel now can travel 330 degrees instead of 180 degrees. A new stop has yet to be fashioned to limit travel to 210, 240, or 270 degrees depending on whether 1, 2, or 3 new WARC bands are to be designed into the transmitter (or receiver).

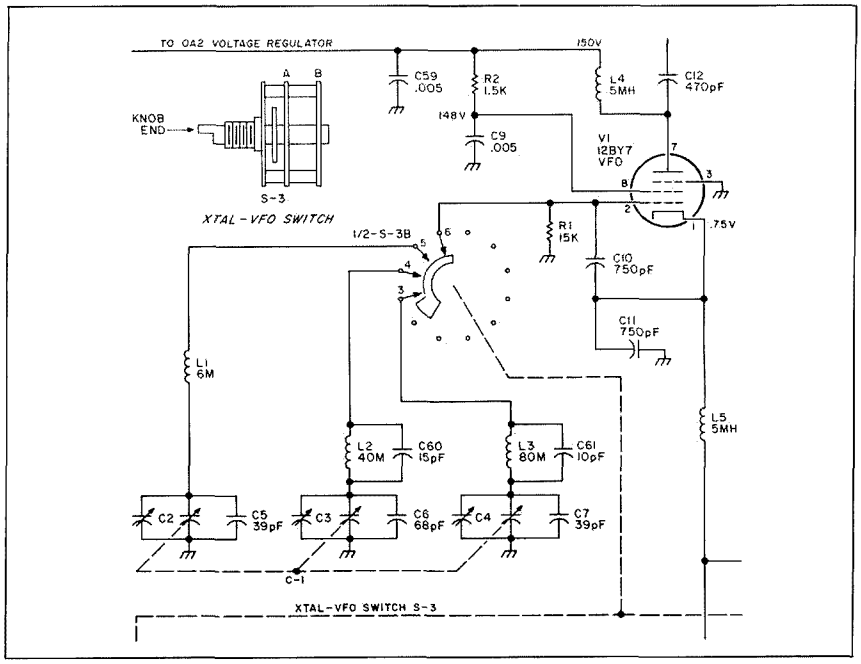

Fig. 4. The vfo circuit of the Allied T-150A transmitter. The 80m tank oscillates on 160m, and the 40m tank is on 80m. The 6m tank runs from 8.333 to 9 MHz.

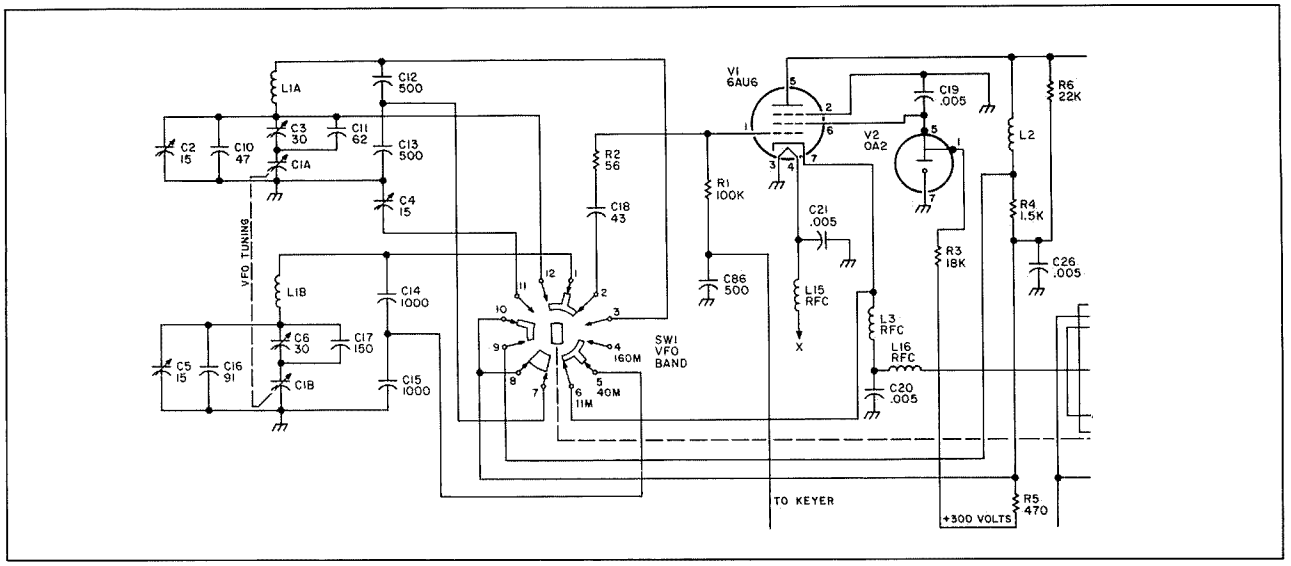

Fig. 5. Note the number of capacitors used in the Johnson Ranger's tuned circuits. The unit covers 80, 40, 20, 15, 11, and 10 meters.

bandswitch. But if you can't, don't be afraid to perform major surgery.

Isolating the bandswitch from the unit and working on it separately is the best approach (see Photo D). The good thing about a bandswitch is that everything comes apart and goes together again—it is mechanical. Don't lose parts, remember their order of removal, and don't use too much force.

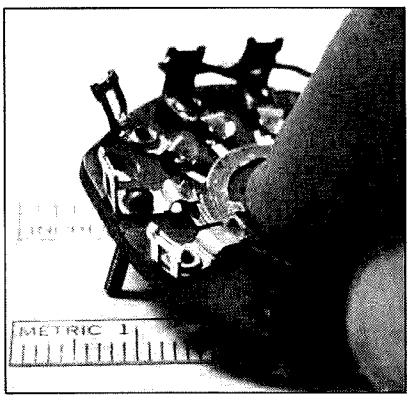

Photo E. Close-up of index assembly showing contact tooth fastened with 0-80 hardware. The 0-80 screw in this photo is a little longer than needed. Note fingers holding wafer.

The individual index assemblies will have to be twisted out of position by removing the two pillars—one on each side. Remove the two long screws running the length of the bandswitch—the tie bolts. *Loosen the tie-bolt nuts, not the screw heads!* Pull out the bolts, and the pillars will fall from position. The wafer indices now will be hanging on discrete parts, or vice versa. Now you are better able to position the wafers for drillouts and modification.

Hardware of 0-80 size (see Photo E) fits the holes and contact teeth of most bandswitching wafers in receiving and low-to-medium-power transmitter circuits of slightly earlier vintage. Make sure you determine the types of new teeth you need to install: the "make" (physically shorter) or "always on" (longer) type. Also, you will have to adjust the stop to give the rotary switch an extra position or positions to travel.

Some stop plates (front of bandswitch) have adjustable stops, but most bandswitches do not since they are usually custom-built. You will have to flatten in the appropriate stamped-out stop (perhaps with a nail-set tool) and devise a way of stopping the switch travel at its new limit and not beyond: I soldered heavy wire pieces onto the stop plate. Other ways are banging in your own stop or adding a small screw—or you can leave it alone (not recommended). Save all the parts carefully and reassemble in the proper order! Also, relabel the front panel as needed.

You can order separate rotary-switch index assemblies through manufacturers' catalogs, choosing your required switching sections, shaft parts, and shaft flat angles (angles at which the switch stops). Another approach is to cannibalize the index assemblies themselves as units and make up your own custom switch. The problem here is that even with a large rotary-switch junk box at your disposal, you probably still won't find every index assembly you need. This is why I go right for rebuilding on the individual slide-contact tooth level. I've gotten to like 0-80 hardware.

Please remember not to tighten tie bolts by their screw heads. Tighten the nuts instead. Also, separate the metal nuts on the ends of

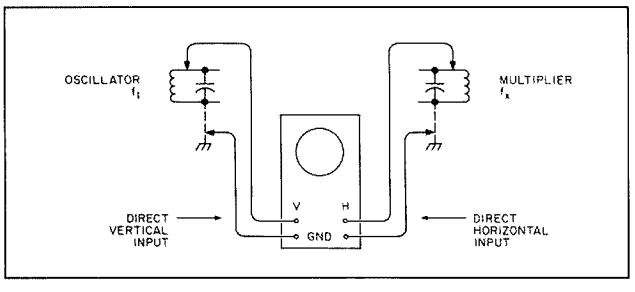

Fig. 6. Use an oscilloscope to determine the multiplication factor of a multiplying stage.

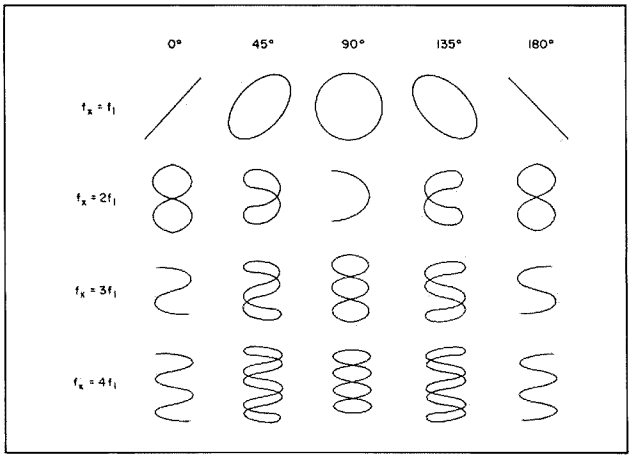

Fig. 7. Lissajous patterns for use with the method in Fig. 6. (Adapted from the Practical Oscilloscope Handbook.*)*

the tie bolts with the phenolic washers and then the split rings before tightening.

Once you have planned your work and installed the new physical switch positions, you must add appropriate LC circuits. Consult the *Handbook* and pull out the grid-dip meter. A few tips will save you time. Say you have an old transmitter that you're converting: Try getting to a flea market to find the same transmitter in fair condition at a good price. Remove whatever coils, brackets, etc. that are needed and add or subtract turns to salvaged coils that are peculiar to the equipment. You'll have your coils, trimmers, lots of spare parts, and less available storage area!

Old TVs and radios have nice coils and cores, a few of which may suit your need with some modification. Also, you can wind a fixed coil using a megohm-size resistor as a coil form. Note that some buffer-circuit coils have shunt resistors anyway and range in value from around 5k to 10k. Coils might even be customized using old rf chokes or coils from which the original winding was removed. An unknown here would be core permeability, so you'd need to experiment with winding your coil. Another approach is to sacrifice the LC circuits of an original band for a new band—winding or unwinding wire on the coil forms and juggling capacitors. Here, you will not need to rebuild the bandswitch mechanically.

The methods suggested here are cut-and-dry. Using some observation, you can look at the 40-meter and 20-meter coils to get an idea of what the in-between 30-meter coils should be like. (Do the same for the 17- and 12-meter bands.) Again, use the grid-dip meter if available, space trimmers and cores at halfway points, and interpolate fixed capacitor values using the NPO types.

There is a bit of a problem with the new ham bands. In addition to their inconvenient locations—on odd frequencies—they are very narrow, making band-spreading a problem. A glance at Table 1 shows bandwidths for these new WARC bands of only 0.4% to 0.55% when compared with the spectrum space below and including each one, whereas the traditional bands vary from 2% (15m) to 12.5% (80m). This means a careful selection of LC components is required to obtain comfortable band-spreading.

This article is a guide, and the table I drew up is to help you with the relative numbers for converting LC circuits in vfo's, receiver rf amplifiers, and antenna circuits. Some equipment, such as a general-coverage receiver, defies conversion. Other equipment, like the Viking I and II transmitters, containing variable inductors in the final, might possibly operate on the new bands with little or no conversion if they had a converted vfo or odd-frequency crystals. (It would be good to hear from those who already have some experience in this area.)

In the case of frequency multiplication, there is the possibility that the doubler, tripler, or quadrupler may be tuned to the wrong frequency! Good output on the wrong

Table 1. For vfo conversions. Before modifying, double-check any numbers for errors! 6 and 2 meters are covered here because these vfo bands fall in the HF spectrum. 11 meters (now CB, of course) was included since some of the early vfo's and transmitters contain the old 11-meter ham band (Johnson Ranger and others). Also, you may find a CB vfo. These should be easy to convert to 12 meters. Note that a 2-meter vfo at 9 to 9.25 MHz (f/16) will cover 17 meters on f/2. Also, a 6-meter vfo at 8.333 to 9 MHz (f/6) can be detuned on the low end to cover 12 meters (f/3). However, you may consider the band-spreading on the first to be inadequate without further conversion. Some combined 6- and 2-meter vfo's have "continuous" band-spread from 8 to 9 MHz. The f/18 of 2 meters is from 8 to 8.222 MHz, but the dial will go to 8.333 as the upstairs 6 meters extends from 8.333 to 9 MHz (f/6) with the same variable capacitor. This is good for 12 meters with reasonable band-spreading. 30 meters is more difficult. If you can get an 80-meter vfo on "90" meters, then you have f/3. Band-spreading is still a problem without more work. "Percent spectrum from f_o" column: $(f_H - f_L)/f_{H} \times 100$ = % spectrum from f_o (0 Hz), and was computed for band-spreading purposes.

harmonic can be confusing. Fig. 6 shows a setup for determining the frequency of an amplifier or multiplier as compared with the frequency of its preceding stage. A broadband oscilloscope is connected to the tank circuits of the stages under test using direct input with the shortest possible leads—the vertical input coming from the oscillator stage and the horizontal input from the multiplier stage.

The corresponding Lissajous pattern (Fig. 7) yields the ratio of multiplication (and phase-difference angles). Switch off the internal sweep on the scope, put the sync selector switch on external, and set both gain controls to zero. Then switch on the transmitter stages and adjust the scope gain controls. Compare your Lissajous pattern for the answer as you tune the buffer/multiplier. If you obtain other unwanted harmonics, avoid those control settings in the future—or better yet, try to design them out. As you may be putting in your own multiplier circuits, try to eliminate unwanted multiplication by adjusting LC values. Again, coil sizes and capacitor values can be interpolated from those on adjacent bands.

There is still much older equipment around with good solid names like Johnson, Heathkit, National, Hammarlund, etc. A lot of the tube stuff will never see 30 meters and the other new bands unless we get used to the idea of conversions. Good luck with all attempts! ■

A VOX In A Box

Malley's Accu-VOX controller gives you a competitive edge with a tape-loop CQer. . . with a tape-loop CQer. . . with a tape-loop CQer. . .

Number 2 on your Feedback card

Current technology offers seemingly limitless equipment opportunities for the CW operator. We are all familiar with filters, memory keyers, keyboards, and visual display readers. *73* has provided us with construction articles for most of these accessories.

Many people feel that keyers are responsible for improving the average fist heard in the CW subbands. Furthermore, the memory feature is indispensible to the contester. It would be nearly impossible to find a high-scoring contest station that doesn't use a memory keyer. The memory advantage is that the operator is given a few free moments for logging, duplicate checking, or other things. Most people find it's difficult to write left-handed while simultaneously sending CW with the right hand!

This is well and good, but it doesn't do much for the phone contesters or other hams who like SSB. They might feel somewhat left out with respect to operating aids. Consequently, I would like to offer my contribution, however small, in the form of a closed-loop cassette tape for CQing or other purposes. Here, the primary advantage is being able to speak after 24, 48, or ?? hours of phone operation.

This is not an original idea, but rather an improvement that provides a way of automatically synchronizing several messages and turning the recorder off after each individual message. Naturally, the recorder could be manually timed, but that requires paying enough attention to remember to release the switch before the beginning of the next message. Anyway, why should the operator need to perform such a menial chore when a much lazier, that is, more time-effective method is available?

I have found that a 20-second closed-loop tape (Radio Shack 43-401) allows the recording of three CQs and still provides time for the recorder to come up to speed. This tape-loop controller is a fairly straightforward circuit to build and does not require any test equipment to calibrate.

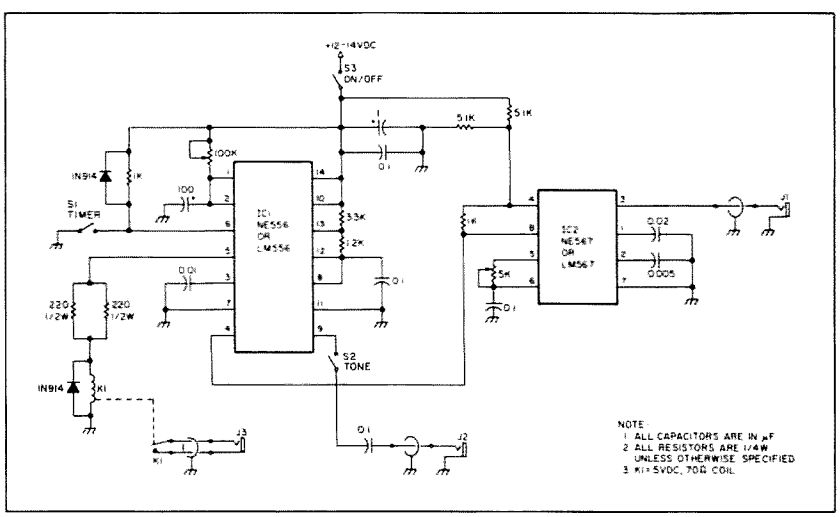

Fig. 1. Schematic diagram of the Accu-VOX controller.

The IC that controls the recorder is an NE556, which consists of two NE555 chips in one package. In our case, the 556 IC is wired both as a timer and an oscillator. A glance at the schematic (Fig. 1) indicates that the circuit also involves a tone decoder. Before you get into the entire circuit, it might be helpful to become familiar with the basic 555 IC itself. If this is old hat for you, just jump ahead to the next section.

The NE555 can be wired to perform either of two functions: a timer (one-shot device) or an oscillator (astable vibrator). The timer produces a constant output voltage for a time approximately equal to the time constant of an external resistor-capacitor combination using the formula: time (seconds) = 1.1 x RC.

As shown in Fig. 2, this device can be wired to be in the normally on mode rather than being normally off.

The timer is started by applying a negative voltage pulse at pin 2, which is the trigger pin of this IC. Additional triggering pulses applied before the device times out have no

Pin No.	Purpose
1 (7)	Discharge
2 (6)	Threshold
3 (5)	Control voltage

5 (3)	Output
6 (2)	Trigger
7 (1)	Ground
8 (2)	Trigger
9 (3)	Output
10 (4)	Reset
11 (5)	Control voltage
12 (6)	Threshold
13 (7)	Discharge
14 (8)	4.5–18 V dc

Table 1. NE556 pinout table. Numbers in parentheses are the corresponding NE555 pins.

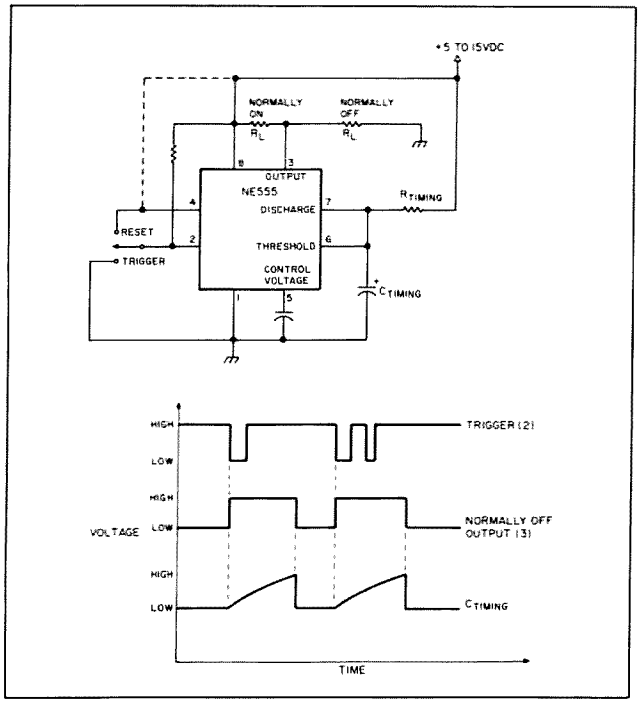

Fig. 2. Wiring and waveform diagrams for an NE555 in timer (monostable) mode. Output pulse (seconds) = R_{timing} x C_{timing}. Note that output duration is unaffected by multiple triggering pulses.

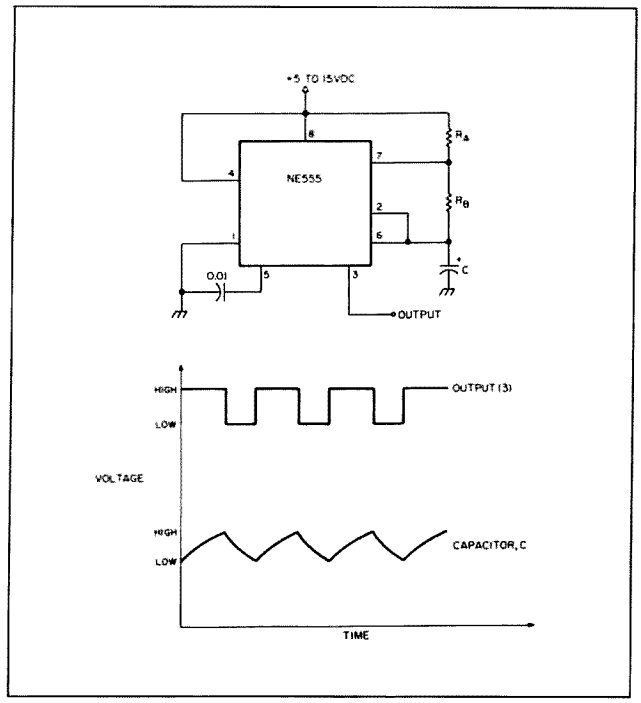

Fig. 3. Wiring and waveforms for astable (oscillating) mode of operation. Output high (seconds) ≈ 0.7(R_A + R_B)C. Output low (seconds) ≈ 0.7(R_B)C. Frequency = 1.44/(R_A + R_B)C.

effect. However, a negative pulse applied to pin 4 during this time will reset the output to its normal (off) state. When the reset feature is not used, it should be connected to the supply voltage to prevent false triggering.

The small capacitor at pin 5 provides an internal reference voltage. The chip is powered by a 5–15-V-dc supply connected between pin 1 (ground) and pin 8. Bypassing the voltage supply at pin 8 to ground with a 1.0-uF and a 0.1-uF capacitor will help keep voltage transients out of this linear IC. The output voltage appears at pin 3 and is about 0.5 volts lower than the supply voltage. This output can source or sink up to 200 mA. The output can be set from less than a second to 15 minutes by proper selection of the resistor and capacitor connected to pins 6 and 7. Substitution of a potentiometer for the fixed resistor results in a timer with a variable latch time.

The wiring diagram in Fig. 3 converts the timer into a square-wave oscillator. This circuit is also called a free-running multivibrator by people who don't like complicated names like oscillator. The frequency of this oscillator is determined according to the following equation: f = 1.44/(R_A + 2R_B)C.

Fig. 3 also shows the waveforms that are present at the more important points of the circuit. Armed with this information, it is a simple matter to make a 10-minute ID timer, code-practice oscillator, or whatever.

Accu-VOX Circuit

A basic timer will not work for the Accu-VOX controller since each of the several messages cannot be made to be the same precise length. The timer would soon become out of synchronization with the messages and havoc would be upon us. The solution is to encode a tone on the tape after each message using the oscillator section of the NE556. Table 1 shows the NE556 pins and the corresponding ones for the NE555.

Another IC, an NE567, is used to decode the tone burst and reset the timer, thus turning

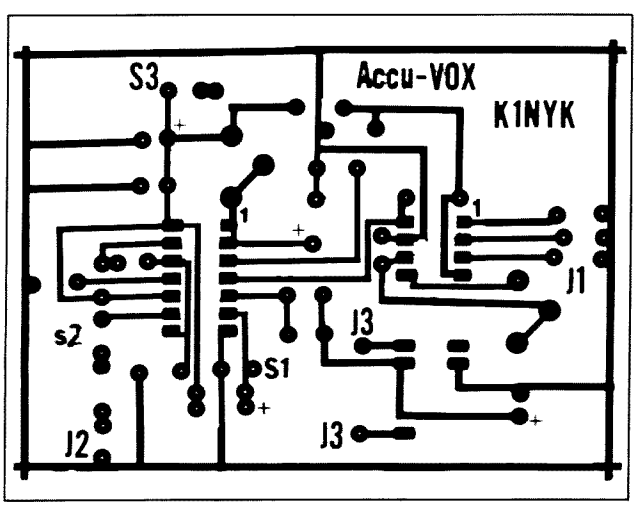

Fig. 4. PC board, foil side.

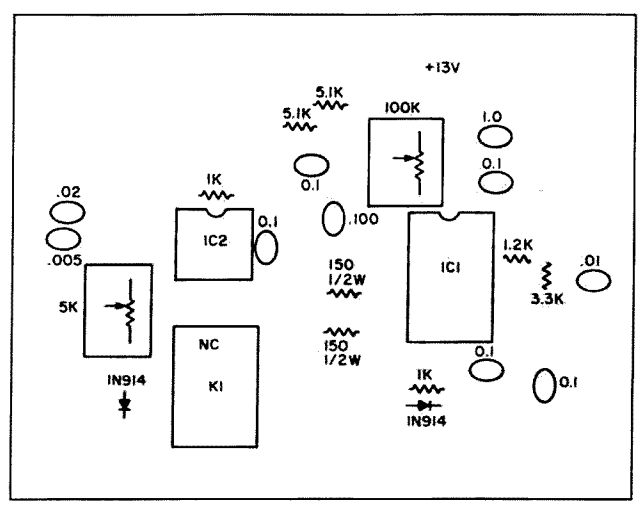

Fig. 5. Parts placement.

off the tape. While TTL chips such as the 74LS121, which draw less current, could have been used for the timer section, the 556 IC requires a less critical supply voltage, reduces the parts count, and is more readily available. In fact, all parts for the Accu-VOX can be obtained from Radio Shack stores or mail-order houses.

The one-shot timer is set to provide a variable delay with a maximum 10–11-second output high, during which time the recorder PTT jack is shorted. Any time longer than each individual message length would be satisfactory. In this case, the length of each message is one-third of the 20-second tape loop.

A reed relay was found to provide more reliable recorder switching than the transistor switch used initially. The diode across the relay coil eliminates back EMFs that are generated when the coil field collapses. The two 220-Ohm resistors drop the output voltage to be compatible with the 5-V-dc relay coil. This circuit can also be powered by a 5-V-dc supply. In this case, the two resistors in series with the relay should be eliminated along with the two 5.1k resistors attached to IC2.

An audio tone of about 2600 Hz was chosen for the encoder so that it would be outside the typical 2200–2400-Hz passband of most SSB transmitters. A potentiometer allows the adjusting of the NE567 decoder to the fixed frequency of the encoder. The decoder operates at a frequency equal to the reciprocal of the RC time constant. The resistor in question is connected between pins 5 and 6, while the capacitor is wired from pin 6 to ground. The output of this chip provides an internally saturated transistor switch to ground at pin 8 when the input signal is within its passband. This requires that pin 8 be biased, which is the job of the 1k resistor between pins 4 and 8. When pin 8 goes low, the resulting negative pulse resets the 556 timer and the recorder is turned off by removing the short on the recorder PTT jack.

There is nothing critical about building this device, although the bypass capacitors should be located as close to the integrated circuits as possible. Point-to-point wiring on a small piece of perfboard is satisfactory, although a better quality product will be obtained with an etched PC board. The PC board, foil side, is shown in Fig. 4. When using an epoxy PC board, I find it's very helpful to hold the completed board up to a light to find any missing or partially soldered connections. The Bakelite™ boards do not allow this trick since they are opaque. Installing the board in a metal enclosure instead of a plastic one will help keep the transmitted rf out of the controller circuitry.

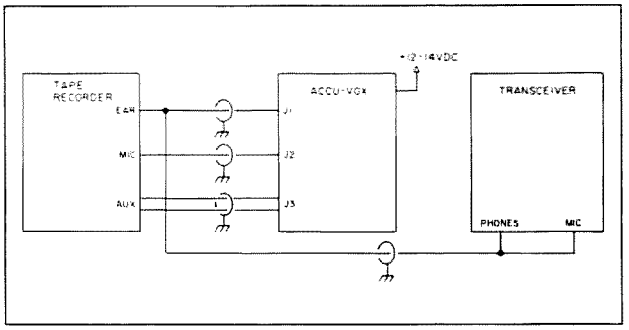

Fig. 6. Interconnection diagram for Accu-VOX.

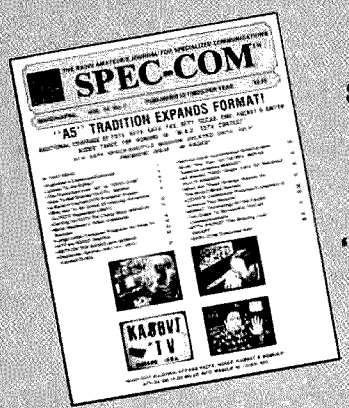
Alignment of the decoder frequency is simple and only requires a voltmeter. Short the mike and earphone jacks together and attach the meter to pin 8 of the decoder. Close S2 and S3 and adjust the 5k potentiometer until the meter reads about zero volts. The optimum pot setting is in the middle of the null voltage passband. Don't forget to remove the short between the two jacks.



The following recorder characteristics are necessary: ac operation, rapid deceleration, and remote mike and PTT jacks. Ac operation is necessary because the current drain is too high for battery operation. I have encountered no rf problems with the ac supply. When such problems are encountered, they can usually be eliminated by winding a few turns of the ac cord around a toroidal core. A rapid motor deceleration is necessary since the recorder motor must stop, rather than slow down, when the PTT switch is opened. This eliminates sequencing problems as well as sending highly distorted audio to the transmitter. The PTT jack is used as explained above. The remote mike is required since internal condenser mikes can pick up too much of the motor noise and also make decoding the tone burst more difficult. Fortunately, most recorders comply with these simple requirements.

After each message is recorded, connect the encoder output to the mike jack and momentarily close the two push-buttons on the controller. This will start the recorder and record the tone burst on the tape. The recorder must be manually turned off after recording each tone. The tone burst can be quite short (e.g., 100 ms) since the decoder's PLL will lock onto the tone very quickly (e.g., 10 ms) at this frequency.

The recorder, Accu-VOX, and rig are then interfaced as shown in Fig. 6. This will allow you to hear the audio from the recorder as it is being sent to the transmitter. With the rig in the VOX (or closed-PTT) mode, momentarily depressing trigger switch S1 will turn the recorder on and transmit one complete message. Closing either S1 or S2 while the message is being sent will have no effect.

I hope you find that this controller will allow your voice to survive the rigors of future SSB operations. See you in the next contest! ■

Split That Audio!

Add a spotter, an audio splitter, and 250,000 points to your next multi-single effort.

Number 3 on your Feedback card

Contesting and home-brewing are what I like best about ham radio, and it's a lot of fun to combine them from time to time. One problem with contesting is that it can take up a lot of time (much of which could be spent sleeping) if you get really serious about it. This situation helped to create a category known as multi-operator, single transmitter. For the uninitiated (well-rested), the multi-single station allows many people to operate one transmitter and thus divide the time up among them. Another feature of the multi-single class is that two or more people can operate together. In this case, a separate receiver is usually involved, so that the second op can hunt for new multipliers while the primary op tries to maintain a high QSO rate by CQing.

It is important for both operators to be able to listen to either receiver at will. A headphone splitter typically provides this capability but can have some drawbacks. This is where the plot thickens—i.e., where I get to the point. One problem is that the audio volume often changes as headphones are switched between the two receivers. This occurs because of impedance mismatch conditions. Since the second receiver is muted during transmit periods, the second operator does not know when his or her partner might need some help pulling a station out of the noise level, QRM, etc. Herein lies the other problem.

Both of these disadvantages are eliminated by modifying the basic headphone splitter circuit shown in Fig. 1 to that of Fig. 2. The modified circuit could also be useful for casual listening where two operators wanted to listen to the radio without using the speaker. The 3PDT switches provide individual receiver selection, constant impedance matching, and sidetone capability. The 10-Ohm, 1/4-Watt resistors avoid the attenuation problem mentioned above. The remaining set of switch contacts allows the sidetone to be heard whenever the station is transmitting. This feature is provided by the transmit relay in the secondary transceiver.

Relay contacts are only provided for the secondary headphones since it is doubtful that the primary operator would listen to the outboard receiver during transmit. If this capability is desired, the unused relay contacts are available and can be wired in a similar fashion.

Some transceivers have a monitor feature to allow the operator to sample his or her transmitted audio. The output of this device could also be connected to the splitter circuit for SSB operation. This is unnecessary with the newer Kenwood (and some other) transceivers in which the monitor feature supplies both the CW sidetone and the SSB sampling.

Power for this circuit is supplied by a small wall transformer. A three-pin voltage regulator was used since the transformer on hand exceeded the 12-volt maximum allowed by the relay coil. There would be no need for either the transformer or the regulator if the proper supply voltage were available from the transceiver itself.

This circuit made no attempt to incorporate individual volume controls, although a pair of LM-386 audio amplifier ICs would work nicely. A generic amplifier circuit with a gain of 20 is shown in Fig. 3 for those who might be interested. All resistors are 1/4 Watt, and the capacitors should have a minimum voltage rating of 25 V dc.

Building the splitter is straightforward and requires only a box large enough to mount the various components. I used an oversized cabinet to keep the switches from being too close together. This avoids the awkward silence that follows when the secondary operator accidentally switches the primary op's headphones just before the VR1's full callsign is copied!

We were just kidding about the 250,000 points. Sorry.—Eds. ■

Nobody Died

. . . but that was the only thing that didn't happen when KT2B and his pals tried contesting for the first time. "Mr. Murphy, meet Pete."

Number 4 on your Feedback card

Although it is many years past and time has somewhat distorted the facts, I'll probably never forget the first time our group made a stab at operating the ARRL September VHF QSO Party.

It couldn't have started out more auspiciously: Here were three amateurs—Ted WA2OHW, Tim WB2OOQ, and me, WB2OHV—newly licensed as of May, 1970, to wreak mayhem on the bands above 50 MHz. Ted was no stranger to amateur radio, as he had been a Novice some years earlier and operated two-meter AM phone. Tim's experience had largely consisted of blowing up a few home-brew stereo amplifiers and wiring up a Knight-Kit 80-6-meter receiver, which actually worked (oddly enough, considering his gift for demolition)!

Myself? I had been an avid pirate radio operator for about five years, taking clock radios apart and putting 12AV6 tubes on 1600 kHz with varied results. I got bored with it, however, and amateur radio seemed the ticket to more excitement. So the three of us took the test and soon received QSL card order forms with our new callsigns from the Little Print Shop in Texas. (Back in those days, that's how you found out whether you passed or not. It took the FCC longer to let you know than Amateur Electronic Supply!)

Initially, our problem was simple: We had virtually no equipment to operate with. Ted had an old Heath HW-20 "Pawnee" rig for 144–148 MHz. This wonder of the western world featured 10 Watts output from a 6360 tube, AM and CW operation, and the most complicated dial cord stringing job seen by modern man. He used conventional RG-8 to feed a Hy-Gain 15-element "Long John" beam and had a respectable signal. For enhanced receive capability, an Ameco CN-144 converter with nuvistor front end was used, driving a Hammarlund HQ-180AC (with clock option, of course).

50 MHz was a distinct possibility, what with Tim's Knight-Kit and an Ameco 50-MHz nuvistor preamplifier ahead of it. Only problem was we didn't have a six-meter transmitter or antenna! 220 and 432 were definitely out of the question. (1296 MHz was right up there with intergalactic space travel as far as we were concerned.)

The immediate problem: Beef up the two-meter station! And we decided to go all the way (never mind our limited construction experience) and build an honest-to-goodness, fire-breathing kilowatt called the "Plumber's Special" from the 1969 ARRL *Handbook*. My father had a fabrication business and this yielded the necessary tubing and metal for the chassis, not to mention the parts for a three-element six-meter beam from the same handbook. (More on this later!)

"Every fuse in Tim's fusebox erupted in a shower of sparks. It was the 4th of July all over again."

Tim was assigned to build the high-voltage supply. This was like asking a pyromaniac to design and install a sprinkler system. Ted was put in charge of scaring up a six-meter transmitter, while I drew the enviable assignment of making up the 144-MHz rf deck. The old man helped out with what he could in procuring parts, and I set to work with a nibbling tool to make the necessary holes in the chassis pan.

Incidentally, nibbling tools should be outlawed as cruel and unusual punishment, especially when cutting out three- and five-inch-diameter holes for blower connections! As a result of hours of flexing the damn thing, I could break small rocks apart in my left hand from overdeveloped metacarpal joints!

Construction proceeded at an erratic pace. Tim located the necessary high-voltage components from Fair Radio and the UPS delivery man suffered a hernia delivering the power transformer. It was a whopper, too—1600 volts @ 750 mA. Tim used solid-state rectifiers from Poly-Paks as well as an enormous quantity of computer-grade electrolytics he scrounged from a barrel at a surplus electronics house nearby.

Ted called me excitedly one night: "I've found a six-meter transmitter! It runs 30 Watts output and uses a vfo!" WOW! A vfo. Now we were in the big leagues. The news inspired Tim so much that he managed to blow up his Knight-Kit receiver by inadvertently connecting ac to the antenna input (I told you he had a knack!), thereby setting our ambitious program back one giant step.

I worked feverishly on the chassis, nibbling away in all my free hours. As high school had recessed for the summer, we each had a fair amount of time to "get it all together," but we still managed to spend most of our time at the beach, the movies, and the local pool. Most of our final assembly took place in late August, by which time Tim had managed to finish the power supply. Ted had successfully repaired the dial cord in his HW-20 (lesser men went to insane asylums attempting the same thing), and I had finished most of the rf deck assembly.

Ah, fate. It can be both kind and cruel. Just when things looked so bleak for the six-meter station, my father got the "bug" and dropped three hundred bucks on a brand new Hallicrafters SX-122, which he agreed we could "borrow" for the contest. Hallelujah! It was off to see John Kakstys W2FNT for a six-meter converter from his used equipment collection. After $15 changed hands, we were back in business. I had also finished building the six-meter beam—entirely out of stainless steel. This had to be not only the most durable six-meter beam on the market, it also had to be the heaviest!

Tim called late one Saturday. "The high-voltage supply is done. Let's check it out!" A few minutes later, we were hunched around

the Masonite meter panel, monitoring screen voltage, plate voltage, and plate current as Tim anxiously threw the switch.

KLUNK. FZZZZZZZZZZTTTTTTTTT. POWWWWWW!!!!

Every fuse in Tim's fusebox erupted in a shower of sparks. It was the 4th of July all over again! The basement went black, and the dreaded voice sounded from the top of the stairs: "TIM! You get up here this minute! What have you done to the television!" Ted and I decided to avoid the lengthy lecture that Tim was being subjected to and went back to Ted's house to plot strategy.

It didn't look too good. Here we were, just a week from the contest, and we still didn't have a decent two-meter amplifier. Not only that, Tim had managed to smoke most of the power supply in his demo, and I came to the realization that even if we had finished the amplifier, I couldn't find any 4CX250s on short notice.

Once again, the fates came to our aid. Ted got wind of a used 5894 amplifier and power supply from a local ham, and armed with $25 (probably his life's savings at the time) closed the deal. Now we could run at least 90–100 Watts if nothing else, and there was no work to be done. He set about integrating it into the station, while I borrowed the 50-MHz setup and attempted to tune the beam.

Tim preferred to keep a low profile until the smoke had cleared, then suddenly announced he would not only fix the supply, but locate the tubes and have the amplifier on the air within a week! (Obviously he had delusions of grandeur. Either that or he believed in the myth of the phoenix!) I took it upon myself to make up log sheets and dupe sheets for the two bands. Ted organized the operating position, and we agreed to meet that Friday afternoon to raise the beams.

The latter was an event in itself. Ted's house had a fairly flat roof, but it was pretty inaccessible. We had to climb from level to level with intermediate ladders to access the top and fasten the rotor, mast, and two yagis. All went well until the ladder fell flat on the second level, leaving us stuck on the roof and Tim with no way to get up from the ground! He decided that asking to borrow a neighbor's ladder was too easy, so he came back with some rope and announced he would scale the side of the house to come to our rescue.

It sounded reasonable, except there was nothing to tie the rope to on the rooftop. What to do? You guessed it, we tied the rope to the mast with the six-meter beam and rotor in place. Tim got up to about the second level before the U-bolts on the chimney bracket gave way and the combination of Tim, mast, antenna, and rotor accelerated at 32 ft/sec^2 until they met the ground with a thunderous crash.

Tim somehow came out of it with only a few scratches, but the mast and beam "bought the farm." Again he had dealt our six-meter station a near-fatal blow, and only a quick trip to the fabrication shop for spare mast and element material saved the day. After this, we chose the safer approach and borrowed three ladders from friends—one for each level. A few hours of groaning and grunting and the six- and two-meter beams were finally in place!

Saturday morning dawned. The contest was only a few hours off now, and we worked at a fever pitch connecting everything together—coax, microphones, rotor cable, lights, converters, receivers, headphones. The log sheets were laid out carefully, and about 50 pencils sharpened. Ted thoughtfully located isolated circuit breakers and marked them with a red pen for easy identification. Yep, we were sure in control. The only thing that didn't make sense was the six-meter transmitter setup.

Here was a homemade unit using a pair of 5763 tubes to produce what the owner claimed was 30 Watts output. Actually, it was more like 15 Watts but so what, we couldn't measure it anyway! Tim relied heavily on a Quement Electronics swr bridge ("Good to 150 MHz!" the ads shouted) to ring out the coax lines, and pronounced everything ready. He had also set up the recently deceased HV power supply in another room, determined to get it working during the contest. A call had been made and a local source seemed promising for the 4CX250s, assuming we could work out a trade, so I reluctantly brought along the rf deck to make Tim happy while he wasn't operating. A last-minute search turned up a CW key, and we were ready to take on the world!

"The stainless-steel six-meter beam was not only the most durable beam we'd seen . . . it was also the heaviest."

Five. Four. Three. Two. One. 2 p.m.! Ted keyed the microphone on the HW-20 and turned towards the plate current meter, mumbling "CQ . . . CQ . . . CQ contest from WA2OHW . . . CQ . . . CQ . . ."

Nothing.

Not so much as a slight deflection. Panic gripped our faces. "Tim!" we shouted. "I didn't do it!" came the response from the next room. A few minutes of searching revealed the answer: We'd failed to provide some means of keying the bias from standby to transmit! Out came the soldering gun, and in a few minutes a hastily wired jumper of #16 speaker wire ran from the amplifier to the Dow-Key contacts. AHHH! That was more like it. From our calculations, we were running about 120 Watts input to the 5894. Ted again started calling CQ, and the band came alive with calls (most of them ignoring us).

I went on six meters and the phone rang about two minutes later. "Whaddyatryintadotamytelevision! You kids outta be thrown in jail I can't watch the game what's all these lines all over the screen knock it OFFF!!!" Click. Ah, well. Never liked that neighbor anyway. He drank too much. I persisted calling CQ and the phone rang again, so we took it off the hook.

Ted got lucky and started running stations. Of course, they were all Big Guns, so his run lasted about 20 minutes and ended abruptly. At least we had about 30 stations in the log! Too bad we couldn't work the "Donald Duckers" on SSB! Six meters was dismal. I couldn't hear a thing! A lengthy inspection revealed a bad piece of coax from the converter to the receiver. In addition, the "standby" jumper was in place, muting the SX-122. These problems were soon rectified and in time I actually started hearing signals! This was exciting!

Tim was furiously laboring in the next room, and the smell of rosin floated through the air. Ted switched to CW and managed to have the key disassemble itself into several pieces including two small springs which he promptly stepped on and flattened for good. "Ah, who needs CW anyway. We'll get 'em on phone!" he cried, and proceeded to call CQ for 15 minutes in the CW position. When he dropped the PTT line, we were greeted with "Hey, you lid! Go tune up somewhere else! There's a contest going on!" At last—we were finally getting out!

Ted's mother showed up with much needed hamburgers around 6:30, and we took a break to chow down and assess the situation. I had managed to work a grand total of 16 stations on six meters since locating the bad cables. Ted had piled up 50 stations on two. It wasn't what we had hoped for, but any port in a storm, as they say! Tim was absolutely determined to get the HV supply working, and his determination paid off—he had completed the repairs by 7 p.m. In order to avoid the previous problems with sparking, he had incorporated some sort of "load standby" switch (the function of which escaped me) to protect against a current surge as the bank of 30 capacitors charged up.

It was agreed that we would operate for another two hours, then take a break to test the supply. If everything worked okay, I'd call the local tube source, get the tubes, and with luck we'd be on by that night with a kilowatt. Sounded pretty easy at the time, so Ted went back on two meters and Tim took a shot at six.

Right away it became apparent that something was wrong with the six-meter beam headings. Two meters peaked fine, but six was almost 90 degrees off! It didn't seem possible, and yet—I ran outside. Sure enough, the six-meter "stainless special" had pinwheeled around almost a quarter turn. Another lousy installation job! I informed the guys of our situation and prepared to again climb the roof to effect repairs when Mr. Drunk from next door sprang out from the nearby azalea bush. "You delinquents! I'm calling the police. This is a damned nuisance! I demand that you stop interfering with—" At this point his foot engaged the coiled garden hose by Ted's back door and he went down in a heap on the back lawn. I scrambled

1987 CALLBOOKS

The "Flying Horse" sets the standards

Continuing a 66 year tradition, there are three new Callbooks for 1987.

The North American Callbook lists the calls, names, and address information for licensed amateurs in all countries from Canada to Panama including Greenland, Bermuda, and the Caribbean islands plus Hawaii and the U.S. possessions.

The International Callbook lists the amateurs in countries outside North America. Coverage includes South America, Europe, Africa, Asia, and the Pacific area.

The 1987 Callbook Supplement is a new idea in Callbook updates; it lists the activity in both the North American and International Callbooks. Published June 1, 1987, this Supplement will include all the new licenses, address changes, and call sign changes for the preceding 6 months.

Publication date for the 1987 Callbooks is December 1, 1986. See your dealer or order now directly from the publisher.

□ North American Callbook
incl. shipping within USA $28.00
incl. shipping to foreign countries 30.00

□ International Callbook
incl. shipping within USA $28.00
incl. shipping to foreign countries 30.00

□ Callbook Supplement, published June 1st
incl. shipping within USA $13.00
incl. shipping to foreign countries 14.00

SPECIAL OFFER

□ Both N.A. & International Callbooks
incl. shipping within USA $53.00
incl. shipping to foreign countries 58.00

back inside, slamming and locking the door behind me.

I'd have to make a try from the second floor. It was definitely hazardous-pay time as I slipped through a bathroom window and carefully stepped along about a foot-wide section of overhang. Upon reaching the end of the window, I managed to slide up the flashing and straddle the roof, edging closer to the beam.

Back in the shack, Ted had hooked into another run of sorts and was logging furiously. Tim still managed to work another ten or so stations off the sides of the beam, and Mr. Drunk gave up and went back to whatever he could salvage of his TV program.

I firmly grasped the mast and stood up, balanced precariously on the roof peak. "Never mind the heights, just fix the antenna!" I thought to myself. I loosened a few nuts and the beam slid down to the rotor cap ever so gently. This would be easy indeed! I removed the mast-to-boom clamps and balanced the beam on the rotor, reaching into my back pocket for longer, stronger clamps.

At that moment, Ted (no doubt caught up in the hysteria of the contest) jerked the rotor to the north, then back south contrary to my instructions to leave it alone. I lost my balance and clutched at the first thing I could grab—the six-meter beam, currently fastened to nothing. Beam and I began a long alpine slide ride down the flashing toward the gutters. As my life flashed in front of my eyes, I also spotted a vent pipe passing by and grabbed hold. The six-meter beam continued by like a stainless-steel avalanche and, with a flourish, flew off the roof to come to a sudden crash on the side of the house. The coax had held! Phewwwww...

Tim chose that moment to come out and inform me of the impending test of the born-again HV supply. He took one look and ran back inside, only to return with Ted and Ted's mother.

"What are you doing up there?" she screamed. I smiled nonchalantly. "Nice view, isn't it?" I said, legs waving in midair. "I'll call the fire department!" she yelled, although Ted persuaded her that that would be unnecessary and soon rescued me with the three-ladder trick.

Now we had a real problem, as the six-meter beam was suspended by an old piece of RG-8 about 15 feet above the ground alongside the kitchen windows. It was decided to take a break and plan strategy as well as test the rebuilt supply.

Tim authoritatively threw the main switch. Again, the hummm and click as before. The lights remained on, however, and the plate voltage meter indicated—lo and behold—2000 volts! He'd done it!

Whatever I thought of Tim's abilities changed at that point, for in the next instant he flipped his "load standby" switch and with an enormous WHUMPPPP the lights in the room dimmed, came up, and started oscillating between on and off at about 60 Hz. The TV picture grew, shrunk, grew again, and shrunk again. The coffee percolator downstairs blew a fuse, the toaster died, the refrigerator ground to a halt, and finally all of the house lights went out in a spectacular flash.

As I sat there in the dark, I contemplated the advantages of stamp collecting. No HV supplies. No antennas. No bad coax. Ted's mother stumbled through the house looking for a flashlight, cursing us to all her ancestors. And at that moment, as if to add a punctuation mark, the coax holding the six-meter beam parted company with its connector, and the beam resumed its appointment with the ground, smashing to pieces seconds later. At least that resolved the six-meter problems!

After much groping in the dark, we managed to reset the tripped breakers and gave up on six meters. Two would be our mainstay for the rest of the contest. We quietly buried the HV supply in the garage and went back to work on two, humbled by the experience.

The evening wore on. We varied the routine with old movies on TV, lots of junk food, and catching sleep here and there. Tim put a yeoman's shift in during the wee hours, and the next morning found us with about 125 QSOs on 144 MHz. The 5894 purred along contentedly and all was well until the rotor stopped.

This was a disaster of major proportions! Losing six meters was bad enough. Tim was dispatched to the attic to locate another hunk of rotor cable Ted "thought" he had left up there. Tim proceeded with haste and began searching the third-floor/attic area. After a few minutes of looking, he swung a door around to check behind it. Click! The door closed in the latch. Clunk! The door handle fell off. Tim panicked and pulled the other knob off, allowing the shaft to drop through to the other side. He was definitely locked in for good!

Ted and I got tired of waiting, thinking Tim had gone back to his house to look for more cable. After about a half hour, we left the shack and went down to the kitchen to get something to eat—far away from poor Tim! His cries for help went unheard as we turned on the television and settled down to stuff our faces.

After about an hour of waiting, we called his house. No, Tim hadn't come home. Hmmm. I tried his neighbor. No, he hadn't seen him. Where could he have gone? Ted decided to look for the cable himself. It was only a matter of time before he found the locked door with Tim flailing away at it trying to break it down. It was HOT in that attic!

Needless to say, Tim lost his appetite for contesting and decided to call it quits Sunday afternoon. Ted and I stuck it out till about 7 p.m. that night when, with four hours to go, the 5894 died. We'd worked about 150 stations on the two bands and nearly 15 sections, so it wasn't a total loss, but it was nearly a year before we decided to try it again!

(Before you ask, yes, the dial cord broke in the HW-20 right as we signed off at the end!)■

Bob Heil K9EID

Everybody Equalize!

2 kW into a four-element monster at 90 feet, and still nobody answers your call! Maybe it's because they can't understand what you're saying . . .

Number 5 on your Feedback card

Bob Heil K9EID is the president of Heil, Ltd.

Back in the AM days, it seemed as if everyone was conscious of his audio quality. Many of the signals you tuned across had better audio than the local broadcast stations. Solid lows, crisp sparkling highs, and no distortion—just good, clean, understandable audio. What ever happened to those operators? Most would hasten to answer that SSB came into being and destroyed that great ability to have super audio. Yes, SSB did restrict the bandwidth from around 6 kHz down to 3 kHz. But as time progressed, it seemed as if this bandwidth just continued to get smaller and smaller.

SSB didn't ruin great audio. The biggest factors in the decline of super audio are improper equalization of the microphone line and the transmitter audio-input parameters.

Two-Year Study

A two-year study of the 160-, 75-, 40-, and 20-meter bands has just been completed using very high quality audio analytical equipment. The engineers performing this important study were not amateur radio operators, but professional sound reinforcement technicians and recording studio engineers. Their studies are very interesting—if not shocking! Almost 70%—yes, 70%—of the SSB signals on the air today have very little, if any, audio response above 1800 Hz! Most of these have a huge peak of +10 to +12 dB at 500 Hz and lower, which ends up giving an audio response that looks like a ride at Disneyland, instead of a nice smooth response with a slight rise in the top end for that added punch and clarity so vital to cutting through the pileups.

The first move of an operator who becomes aware of an audio problem is to try a compressor, or clipper, trying to "clear up" these gross problems of improper equalization. In the majority of cases, these types of electronic devices aggravate the problem—their operators don't fully understand how to use them. This causes low-level microphone circuits to be overdriven into horrible clipping, thereby causing massive distortion. The mike inputs of most transmitters are set up to accept 40 to 50 millivolts maximum. Most of these compressors or processors (if you wish) are capable of producing well over 2 volts! In addition, they do very little to improve the lumpy frequency-response curve and simply add distortion as the preamp is overloaded.

Equalization

It is apparent from all of the studies that equalization is the answer. One can use practically any microphone and equalize it to sound perfectly natural on any transmitter. With active equalization, you can adjust the amount of high and low frequency response as needed for a given microphone/transmitter/voice combination.

Recording studios and broadcast transmitters, not to mention telephone lines, PA systems, etc., use some form of equalization to flatten out and equalize the response curve so that you hear the voice as a natural sound, not one filled with extra frequencies and harmonic distortion that have been added by improper electronic equipment.

Bell Laboratories has been studying the phenomenon of human hearing for years. It is a continuing process with this great laboratory to help us understand what we hear and why we hear it. Without any type of equalization in our microphone lines, the transmitter merely sends the audio responses that the microphone and speech audio preamp for the transmitter add to the situation. As Bell concluded, our hearing is very, very sensitive in the mid-range and needs some help in the upper regions, while it is very deficient in the lower extremes. When trying to copy the majority of signals, you'll find they do not have enough mid-range and high responses to them. Most exhibit entirely too much low end and therefore are impossible to pull from the noise and interference of the adjacent signals.

The EQ-300 Microphone Equalizer from Heil, Ltd., can be used to correct this problem. The device has two active audio filters: the low filter at 490 Hz and the high filter at 2400 Hz. Both are capable of a 20-dB boost and a 20-dB cut at those two frequencies, so that equalization of a microphone becomes very easy by simply plugging the microphone into the equalizer and connecting the output of the equalizer into a transmitter's microphone input. Listening to a second receiver (using headsets) while transmitting will allow the operator to equalize the microphone response easily.

Proper Microphone Technique

It is very important to use proper microphone technique to avoid extraneous background noises. Ever tune across somebody and notice that the fan in his amplifier blower is louder than his voice? His explanation that the fan is loud or that he is "running a lot of power" is not the correct explanation of the situation. He is usually speaking 12" to 36" from the microphone with the mike gain cranked and the unequalized processor wide open, causing the background noise in the room to be louder than his actual voice.

Microphones for communication were designed to be very close-talked. It is not proper to sit back away from a microphone and expect to have that commanding signal on the band. The important mid-range frequencies are lost, the highs are diminished, and what gets left are many of the lows and much of the room resonance that overrides just about any audio present.

To correct this and ensure that your signal has that terrific mid-range punch, free from the many extraneous background noise, run the microphone gain as low as possible to achieve good ALC action and speak no more than one to two inches from your microphone. It is the accepted practice in professional communications and it is the only way to achieve good solid audio. This does nothing for the equalization, but does help the signal-to-noise ratio of the audio system.

Microphone Cartridge Response

Surprisingly, the majority of microphones

sold to the amateur radio market are not built by those manufacturers whose name brand they carry. There are only two major manufacturers—in the Orient—that are building most of the microphones. As long as a mike is the same color as a rig and has the correct connector, it is advertised as "matching"—with absolutely no consideration being given to the response, drive, or overall characteristics for use in the amateur radio market.

The majority of microphones are dynamic and produce a very bassy, muddy response. Some of the newer microphones are electret and are even worse in response. Electret elements are very cheaply built and widely used due to the high profit they can produce.

The old crystal and ceramic microphones had wonderful audio responses when used with the older tube rigs. Those cartridges were several million Ohms in impedance and, of course, the tube inputs were also typically 2 to 3 million Ohms, so everything was super sounding. However, here we are in 1986, and all rigs built today use solid-state audio preamplifiers that have, typically, 800 to 1500 Ohms input.

Plugging the wonderful old 1935 D-104, an extremely high impedance microphone, into the new rigs places that cartridge in an almost direct-to-ground short, which does horrible things to this great old microphone. First, the drive is greatly reduced, which is no big deal. However, this terrific mismatch (3 million Ohms to 800 Ohms!) rolls off the low end of the audio and puts a ridiculous peak in the mid-range, making the response sound like a telephone. Yes, it is easy to understand in the pileups when compared to the "stock" dynamic, but it only allows the bandwidth of your signal to become less than two octaves and this just doesn't give you the commanding signal needed in the pileups.

Power Bandwidth

It is important to realize that just having a wattmeter in line doesn't tell the whole story. If you use a microphone that has an extremely peaky audio response, the majority of your power will be at that frequency. Using a stock dynamic mike means that usable parts of your power will be in the low-frequency, muddy-sounding part of the spectrum when your brain is searching desperately to hear from 1500 through 2200 Hz, so the articulation of the words can be understood. Did he say a "P" or a "B"? Was it an "F" or an "S"? Without the proper balance of highs and lows, the brain can't distinguish this—no matter how much power you are running.

100 Watts Beats Out The Big Signal

To really drive this subject home, after several years of study we erected two TA-33 beams at 60′ on separate towers. A stock TS-820S with Kenwood's "matching" MC-50 microphone drove a stock Heath SB-220 amplifier. The second station, located on the same test bench, was a Kenwood TS-120, which was driven with a Heil HC-3 "key element" and the EQ-200 Microphone Equalizer. A $20,000 audio analyzer was attached to the TS-120 and the audio was equalized for maximum response, keeping the Fletcher-Munson curve of the human ear well in mind.

Two amateurs operated the test stations. One station was properly equalized and produced 100 Watts of power into the antenna from 300 to 2400 Hz, with a 10-dB rise at 2200 Hz. The second station was producing 800 Watts of rf from 200 to 1400 Hz, but the output was less than 100 Watts at 2200 Hz. Both stations entered a pileup on the same frequency calling some European stations. In four separate runs, the 100-Watt station was answered first. On the fourth run, the foreign amateur was asked why he answered the smaller station: "Didn't you hear my friend standing here beside me running nearly the legal limit?" The response from the European was, "I couldn't understand any other signals in the pileup but yours!"

The reason for this was that the properly equalized station actually had more talk power at the frequency response that the human ear needs to receive—which made it easier for the brain to make those articulate decisions as to what was said. Stacked KT-34s and parallel Alpha amps are just *not* necessarily the answer. So many times you will hear fellows make that ridiculous assumption—the more power, the better. What we all should learn and learn well is that it is not how much power you are running that makes the difference, but what the audio power bandwidth of that power is.

Become aware of proper audio response. Remember: Hearing is a physical process; listening is a mental process. Become a good listener—improve the sound of your signal and help clean up our airwaves. Art Collins never intended for SSB to deteriorate to some of the signals you can tune across today. ■

EQUALIZATION FOR CONTEST AND DX OPERATION

I recently learned about audio equalization of amateur radio signals, and frankly my first thought was "here we go again, another gadget to clutter up the ham shack." Interestingly, though, I searched further and was able to learn more from Bob Heil, guru of high-quality concert audio systems.

Yes, I do have an MC-50 Kenwood microphone. I bought it because it looked flashy and I assumed that Kenwood designed it for amateur use, but I apparently was wrong. I performed several experiments and found that Heil's treatment of covering the ports of the mike helped the performance by rolling off some of the unwanted low end. In reading several articles by Heil, I thought perhaps there was something to all of this. I was never concerned or even knew about sibilance (the ability of an acoustic system to reproduce without distortion the extreme high frequencies that contain the "S" and "T" sounds). Even with the gimmick-fixed MC-50, I did not get that needed sibilance.

In short, I obtained one of Heil's EQ-200 Microphone Equalizers for testing. To perform the test, I developed a list of words that could be very confusing if the "S" and "T" sounds were missing (Category A). Also, I included words that contained a dipthong (Category B), which requires an extraordinary "puff" of air—enough to drive an unequalized bass-emphasizing mike like the MC-50 or MD-1 crazy. A partial list of words utilized follows:

Category A			Category B	
steam	score	strip	trash	throw
speak	sink	scream	thicket	thrust
scab	space	send	tweed	thwart
scar	stop	tact	twig	throng

These words were utilized in an on-the-air test conducted intentionally under less than ideal conditions—lots of QRN and QRM. During the tests, the listeners were requested to record what they heard and read it back. With the Heil equalizer in line, the listeners were three times more likely to hear correctly what was said.

It must be stated that most listeners first stated that they liked the sound of the MC-50 unequalized, as it sounded more like me. I attributed their preferences to the fact that Americans equate bassness with quality and that they were not used to flat or "equalized" audio. In fact, many thought I was running a processor. Interestingly, a processor in effect eliminates the overemphasized bass of most microphones by clipping it out. Unfortunately, the combination of overdriving the speech amplifier of the rig with overdriving the processor causes much of the distortion and splatter on today's crowded bands. Thus, one should equalize the microphone first, then process it if necessary.

We also tested the EQ-200 equalizer with the Pro Com 200 headset and a Drake microphone, which had the original Astatic element removed and replaced with a new Heil HC-3 "key element," which is a specially tailored element for amateur communication. The HC-3 and the EQ-200 equalizer combination produced studio-quality audio.

To be sure, the equalization of a microphone is not in the same category as a 2-kW amp or a 150-foot tower, but the audio must be right for those items to be most effective. The additional clarity provided by the higher quality Heil audio made my venture into the North American SSB Sprint very successful. Even in that fast-moving contest, three contestants stopped long enough to mention that I had excellent audio!

This Pileup's For *You!*

You don't have to fly to the ends of the earth to have a popular signal. Here are three tricks to bring the screaming hordes onto your frequency.

Number 6 on your Feedback card

Have you ever felt envious listening to a DX station that was underneath a gigantic pileup? The popularity must be great fun—with so many people yelling and screaming into their microphones or pressing their CW keys right through the table top. Would you like to experience the fun of having the guys (and gals) standing in line just to work you, too? Well, it can happen, and you do not have to go on an expedition to a coral reef or a northern iceberg—it's easier than you think.

You do need at least an average signal for the techniques I am going to describe. Even a real DX prize cannot create a pileup if no one can hear him. So let us assume you have a few hundred Watts and a good antenna. If you're willing to answer lots of QSLs, you're ready to go.

Take Off

Go where? My first suggestion is to go on a little DXpedition to Vermont, Delaware, or Wyoming. These states contain only around 800 licensed hams each, which is much less than most DX countries. Even Hawaii has twice as many. Because we live only a few hundred miles from them, we may not realize how much in demand these little states are to our brothers in Europe and Asia. Go there and put out a reasonable signal on 10, 15, or 20 meters and watch what happens. They will crawl all over each other to work you and get a QSL card.

Novice DX

If you cannot leave your home QTH, there are other ways to attract a crowd. Many European countries and Japan offer Novice-type licenses with power limits of only 10 Watts or less. If you are running 200 Watts and you have a hot enough receiver so you can hear them, they will hear you for sure and you will have a 13-dB advantage that will attract them faster than you can work them. This works well on CW. I like 15 meters best. Be sure to keep your code speed down because these guys are beginners. And in case you haven't guessed, every single one of them will want QSLs from the DX states of New York, California, and Texas.

Be A Personality

My third suggestion for attracting a pileup is to become a special personality. King Hussein of Jordan attracted pileups on 2-meter repeaters when he visited California. Barry Goldwater is in such demand that he hires a staff to run his station. And Arthur Godfrey . . . well, what can I say? But if you cannot become a great politician or a king, what can you do?

"When he called CQ, he would add: 'No lids, no kids, no YLs, no XYLs, no bus drivers, no hitchhikers, no space cadets, no phonetics.' "

I'd like to describe some special personalities I have contacted and you will see. There was John King of the giant King Ranch in Texas who used to frequent 15-meter phone. John had a very powerful and very attractive Texas accent. When listening to his voice, you just knew that he was the fastest, straightest shot west of the Pecos.

John's voice and quick wit made him a real Pied Piper. He kept his QSOs very short, so no one could get to know him too well, and this added an air of mystery to the "stranger from Texas." As soon as he said "so long" to his contact, the frequency would explode with callers. If you practice your Texas accent for a few weeks and develop a handful of original phrases, you will be ready to take over where John King left off.

As for me, I have always found that the voice and personality of my friend Damon WB2PEL strongly attracts my attention. Damon can do "a John King" without even trying. But the rest of us may need a little practice first. While you are at it, why not become proficient as John Wayne, Humphrey Bogart, or Peter Lorre? I have been told often that I sound like Dick Cavett, but that has yet to create pileups around my signal. Most people just tell me I sound familiar, but they are not sure why.

Back in the 1950s, I encountered the most famous personality of 75-meter phone in the East. He was W2OY from Lancaster, New York, "the man we loved to hate." Mike would make a practice of being the most critical and grouchiest stinker on the band. He was *mean!* When he called CQ, he would add: "No lids, no kids, no YLs, no XYLs, no bus drivers, no hitchhikers, no space cadets, no phonetics." He was *rotten!*

When he was in QSO, the lids would swish their vfos back and forth to QRM him. The "kids" even recorded his signal and replayed it outside of the band. He was *hated!* But he got a lot of attention and a lot of QSOs. The first time I talked to him, he criticized me strongly for asking, "How do you copy?" "You only *copy* CW," he told me.

After a few more contacts with Mike, I began to suspect something. And when I met him at the Rochester Hamfest, it was confirmed: It was all a big put-on. W2OY was one of the nicest guys you would ever want to meet. But over the air, his many friends never let on. We were saddened to learn of his death which was caused by a heart attack while he was up on his tower many years ago. Who will be the next W2OY? Perhaps it could be you.

So you see, if you want popularity on the ham bands, there are many tricks that work. Tell them you are using solar power. Tell them you are trying to break the Guinness record for QSOs while standing on your head. Tell them you are Jimmy Cagney or Boris Karloff. But don't use Dick Cavett—that one is mine. ■

Narrow-Minded Filtering

Spend fifteen minutes tinkering with this switched-cap filter for CW: You'll wonder where all of those signals came from!

Number 7 on your Feedback card

Did you ever find yourself in need of a good CW filter? Not just one with a narrow passband at −3 dB, but one with a narrow passband at −40 dB? Well, read on.

The filter I'm talking about has a passband of about 300 Hz, doesn't take up much room, can be run off 9-volt batteries (it takes two), and uses a new approach to the old active filter. One other thing: There are only two chips in this project. One is the RF-5614 filter, the other is a waveform generator.

Now for the filter. The RF-5614 is a monolithic switched-capacitor bandpass filter packaged in an eight-pin mini-DIP. The IC contains a six-pole Chebyshev ANSI class-II bandpass filter using an external-input clock trigger. The center frequency of the filter is tunable by the clock frequency. The distortion can be less than 0.1% with a dynamic range better than 86 dB. The filter will handle input signals of greater than 17 volts p-p with an insertion loss of less than ±0.2 dB.

Some other features are that it is small, it requires no other external components, and the power-supply range may be ±5 volts to ±10 volts. (I used two 9-volt batteries.) The corner frequency range is from 10 Hz to 25 kHz.

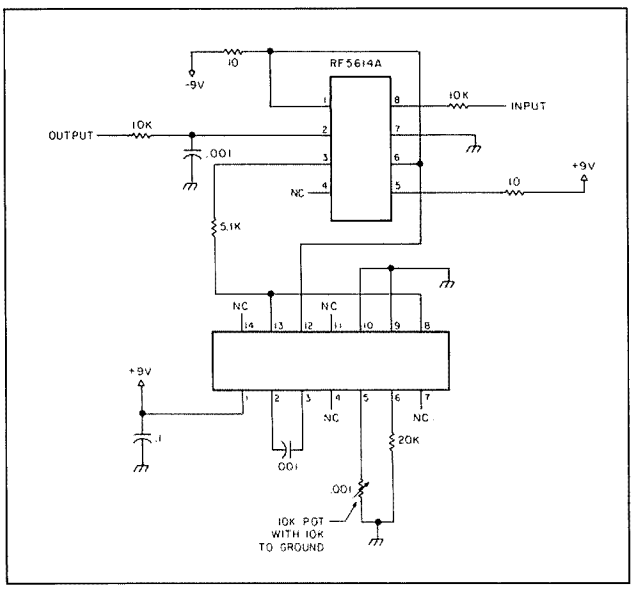

Fig. 1. Schematic of the CW filter.

Operation

The bandpass filter is self-contained and requires only an external clock trigger and a plus and minus power supply. Because the clock trigger sets the control frequency of the passband and also the sampling rate (27 times the control frequency), I will address this first.

As with any sampled data system, signals above half the sampling frequency will be aliased and may appear in the band of interest. If signals greater than 13.5 times the control frequency will be applied to the filter, an external anti-aliasing filter may be required. I found this to be true (as can be seen in the low-pass RC filter on the output in Fig. 1). In applications where the clock residue may affect system performance, a single-pole filter should be added to the filter output.

The trigger-clock frequency is twice the sample rate, or 54 times the center frequency. For a 1-kHz center frequency, the clock must be 54 kHz. The input clock is divided by two in generating the on-chip clock waveform that controls the sampling rate.

One note before moving on: This device is a MOS device and handling precautions

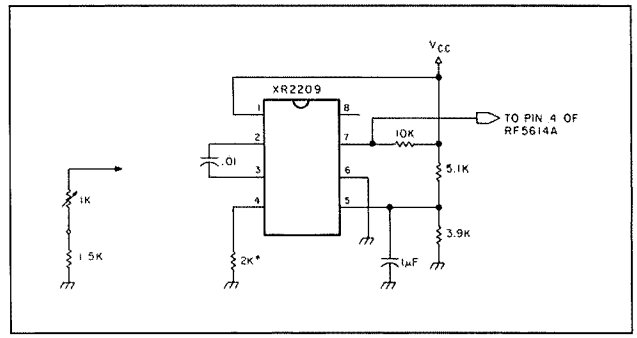

Fig. 2. An alternate clock circuit using the XR-2209. Replacing the 2k-Ohm resistor on pin 4 with the 1.5k/1k pot combination lets you adjust the center frequency from about 790–1320 Hz.

should be used. Don't apply instantaneous supply voltage to the device or insert or remove the device from its socket while it's on. Decoupling networks were added for turn-on/turn-off switching transients and ripple. (There's no ripple with batteries, but I may want to add a dc supply later.)

Trigger Clock

For the trigger-clock, I used an XR-2207 voltage-controlled oscillator chip. The XR-2209 could also be used, but the pinouts are not the same. The power supply can be up to 26 volts from a single or split 12-volt power supply.

Inside the XR-2207 are four main functional blocks for frequency generation: a voltage-controlled oscillator, current switches that are activated by binary-keying inputs, and two buffer amplifiers for triangle- and square-wave outputs. The vco is actually a current-controller oscillator which gets its input from the current switches.

As the output frequency is proportional to the input current, the vco produces four discrete output frequencies. Two binary-input pins determine which timing currents are channeled to the vco. These currents are set by resistors to ground from each of the four timing terminals—pins 4, 5, 6, and 7.

Using the XR-2209

The circuit shown in Fig. 2 will produce an output frequency of 54.21 kHz which, when divided down inside the filter, will give a center frequency of 1.003 kHz (54.21 divided by 54). The center frequency could be set lower or higher by replacing the 2k resistor with a 2.5k, 10-turn pot. Using a 2.4k fixed resistor, the output frequency will be 43.1 kHz, giving a center frequency of 798 Hz.

When using a split power supply, pin 6 has the negative voltage and pin 5 is grounded. A 0.1-nF capacitor should be placed between pins 6 and 5. All other parts stay the same. This description is for the XR-2209 only and not for the XR-2207. For the square-wave output (pin 13), the device is an open collector and is pulled up with a 4.7k resistor.

Parts List

2	10 Ohm, 1/4 W	RS 271-1301
3	1k Ohm, 1/4 W	RS 271-1335

1	XR-2207	EXAR Corp.
1	Aluminum utility case	RS 270-286
1	Experimenter's IC board	RS 276-161

1. Radio Shack.
2. Mouser Electronics, 2401 Highway 27 North, Mansfield TX 76063.
3. EG & G Reticon, 345 Potero Avenue, Sunnyvale CA 94086.
4. EXAR Corp., 750 Palomar Avenue, Sunnyvale CA 94086.

To the Pileups!

Now that you know how each device works, you can put them together to make a nice filter with a passband of about 300 Hz from the −3-dB points. Layout is not critical. I used a piece of 1" x 4-1/8" experimenter's IC board from Radio Shack (# 276-161) and put the filter into a utility case.

I think that you'll enjoy building and using this little filter. See you in the pileups on 20! ■

MERRY CHRISTMAS FROM DAN, SANDI, LAURA, RICK, MARK, BRIAN, FRENCHY AND RUSS

1987 WORLD SSB CHAMPIONSHIPS

Announcing the January Classics—the 1987 running of the World SSB Championships! The first and only contests of their kind, these six individual single-band events are world-renowned and amongst the most challenging events on the bands today. Winners of each contest determine the World Champion for 10-, 15-, 20-, 40-, 75-, and 160-meter single sideband:

0000 UTC January 3, 1987
through 2400 UTC January 4, 1987
1st 10-Meter World SSB Championship

January 10, 1987
0000–2400 UTC
3rd 15-Meter World SSB Championship

January 11, 1987
0000–2400 UTC
3rd 20-Meter World SSB Championship

0000 UTC January 17, 1987
through 2400 UTC January 18, 1987
8th 160-Meter World SSB Championship

January 24, 1987
0000–2400 UTC
6th 40-Meter World SSB Championship

January 25, 1987
0000–2400 UTC
8th 75-Meter World SSB Championship

MISC. RULES:

Stations may be worked only *once per event*. All contacts must be two-way SSB transmissions. All stations, regardless of their operating class, may operate entire contest periods without a rest period.

OPERATOR CLASS:

(a) Single operator, single transmitter, SSB only. (b) Multi-operator, single transmitter, SSB only.

EXCHANGE:

Stations within the continental 48 U.S. states and 13 Canadian provinces or territories transmit RS report and state, province, or territory. All others, including Alaska and Hawaii, transmit RS report and DX country.

QSO POINTS:

5 QSO points for contact within your own continent, 10 QSO points for contact outside your own continent.

MULTIPLIER:

1 multiplier point is earned for each continental U.S. state (48 max.), Canadian province or territory (13 max.), or ARRL DXCC country (excluding the United States or Canada).

DX WINDOW:

For the purpose of this event, DX window frequencies are reserved for *split-frequency operation only*. W/VE stations are not to transmit in the DX window. DX stations may transmit in the DX window but *must* receive *outside* window frequencies. DX Windows: 7.080–7.090; 3.790–3.805; 1.825–1.830; 1.850–1.855, and 1.907–1.913 MHz.

FINAL SCORE:

Total QSO points x multiplier points = claimed score.

CONTEST ENTRIES:

Entries must include (1) a contest log, (2) a dupe sheet for 100 or more contacts, (3) a list of multipliers, and (4) a summary sheet as outlined below. Be sure to include your soapbox comments and a black-and-white photo for possible publication.

SUMMARY SHEET:

Summary Sheets must contain (1) contest callsign, (2) your QTH, (3) station owner's name and address, (4) a list of station equipment and antennas, (5) operator class, (6) total QSO points, (7) total U.S. states worked, (8) Canadian provinces and territories worked, (9) the total of ARRL DXCC countries worked, (10) total multiplier points, (11) claimed score, and (12) if a multi-operator station, a list of participants, by callsign.

ENTRY DEADLINE:

Mail contest entries separately to the contest chairman listed below. Entries must be *postmarked no later than February 18, 1987*. Late entries will be registered as check logs.

DISQUALIFICATION:

Contestants may be disqualified if they run illegal power, cause deliberate interference, fail to comply with the DX window rules, attempt to achieve a scoring advantage, or if the number of duplicate contacts not cancelled exceeds more than 3% of the total contacts made. Contest committee decisions are final.

PENALTIES:

A penalty of 100 QSO points will be assessed for *each* duplicate contact counted in a contestant's claimed score.

AWARDS:

A minimum of 100 QSOs must be worked in an event to be eligible for certificates. Plaques will be issued to World Championship stations who work a minimum of 500 contacts. Awards will be issued in each operator class, in each continental U.S. state, Canadian province and territory, and ARRL DXCC country represented.

2665 N. Busby Road
Oak Harbor WA 98277

WB9HAD, KM5X, and EA3CCN —160-Meter World Champions—

The 1986 single-operator champion distanced the second-place finisher by more than 300 QSOs; the multi-op competition was a barn burner. Only 1,020 points separated *the* champion and his runner-up. *Truly* exciting!

WB9HAD became World Champion in the W/VE single-operator class with 1,431 QSOs, 59 states and provinces, and 16 DX countries on 160. His only challenge came from second-place finisher W3YOZ, who tallied 1,106 QSOs, 56 states and provinces, and 18 DX countries.

For single-op DX stations, our friend EA3CCN earned this year's championship with 196 QSOs, 7 states and provinces, and 35 DX countries. Considering poor European propagation both nights, this effort is to be commended. Hopefully, conditions will be better in '87.

KM5X made its mark in the multi-operator category. This world-championship station slipped past well-known contender WB8IFP by a margin of 1,020 contest points. The big difference was in multipliers. KM5X had 87 total multipliers compared to 77 for WB8IFP. Unfortunately for the runner-up, his higher-latitude location restricted his DX capabilities. [Now you know how we feel in the Northwest! *Hi!*]

Becoming a 160-Meter World Champion places you in a group of some notable Top Band operators. Let's review a bit of 160-meter history:

75-METER SOAPBOX

IK4CFV —Good-bye and good job! Please send rules for next year's contest.

KY1H —Good activity. Wish I could have stayed on 24 hours instead of only six.

KQ3V —I know I passed up several multipliers who were working "straight up" in the window. I think this is one of the best contests going.

KA7STQ—At the age of 15, it's hard to stay up all night after going to school all day Friday and running the 40-meter test, too!

KC7PA —I learned not to use a new rig for the first time during a contest.

KD0OZ —Have to put up an 80-meter antenna next time. Lots of fun!

KV0I —It's rough contesting when the line noise is running 10 over S-9. I was surprised I could do as well as I did.

VE5RA —Was able to work all 50 states and all 13 provinces and territories. [Super job, OM!—KE7C]

VE7AO —Enjoyed the contest very much. Was disappointed at some of the U.S. stations operating in the DX window. Looking forward to next year.

VY1CW —Severe geomagnetic disturbances for the preceeding weekend and strong aurora during the test. At 0600 UTC the band was practically dead.

WA5IYX—Quite a few big thrills; my first KL7, European, and African QSOs on 75 meters.

Single Op	W/VE	DX
1981	W8LRL	C6ADV
1982	W9RE	VP9BO
1983	KC8JH	YV3AZC
1984	WA2SPL	EA3CCN
1985	N7DF	LZ2CJ
1986	WB9HAD	EA3CCN

Multi-Op	W/VE	DX
1981	W4CN	ZF2DX
1982	W8NGO	—
1983	K8ND	YU7JDE
1984	K9ZUH	LZ2CJ
1985	WB8IFP	G6HH
1986	KM5X	—

Were there any world records broken? Of course there were! With Big Guns leading the pack, you expect a shoot-out, right? Here's how this year's efforts fit into the record book for 160-meter QSOs:

WB8IFP	1986	1,522
WB9HAD	1986	1,431
W0CEM	1986	1,338
KM5X	1986	1,313
KC1U	1986	1,210
N7DF	1985	1,177
W0EJ	1985	1,152
N7DF	1984	1,125
W8RA	1986	1,138
W9RE	1982	1,118

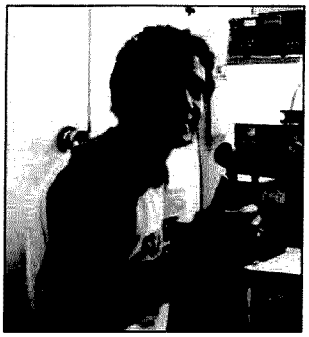
Single Op:				
NR5M	TX	TS-930S	Alpha 77D	2-element yagi; 3 half-wave slopers
K0HA	NE	TS-830S	HB 813s	6-element phased verticals
WB9HAD	IL	TS-930S	Alpha 374	Delta loop and beverages
N4KMY	NC	TS-430S	Clipperton	Quarter-wave slopers
N8CXX	MI	FT-102	SB-220	Inverted vee and vertical
Multi-Op:				
K3TUP	PA	TS-930S	Alpha 77D	4-element vertical, dipole
W8LT	OH	TS-830S	TL-922A	600' longwiro, bobtail
KS9O	IL	C-Line	SB-220	Delta loop, sloper
NK7U	OR	TS-930S	Alpha 78	Delta loop, vertical
KS3F	PA	TS-930S	Alpha 76	Inverted vee

Table 2. Antenna systems for the top-ten 75-meter stations.

Can you imagine 1,500 QSOs on 160? Now you see why our events are said to be the busiest going. There were more than 3,500 stations on the band, so you have to ask why WB8IFP didn't work the other 2,000? The obvious answer is that time ran out or he probably would have.

How did everyone else fare? Stations with 1,000 or more QSOs included: WB8IFP (1,522), WB9HAD (1,431), W0CEM (1,338), KM5X (1,313), KC1U (1,210), W8RA (1,138), W3YOZ (1,106), W4SEL (1,097), KC8P (1,050), and K3ZO (1,030).

On 160, multipliers are at a premium. Stations with 50 or more states and provinces to their credit included: K3ZO (61); KV0I (60); W0CEM and WB9HAD (59 each); KM5X (58); NK7U and K7VIC (57); KC1U, W4SEL, W8RA, KC5DX, KF4HK, W3YOZ, KC8P, and VE3NNR (56); K2RIH and VE5RA (55); W0EJ, K6HNZ, and K7OQ (54); W4MTR and N4LTA (53); VE3WR (52); WA1UJU and KA1SR (51); W4UWC, N3EHD, W9MQZ, VE4JB, and N4BSN (50).



Stations capable of DX are usually the winners. Those working 10 or more DX countries included: KM5X (29); KC1U (21); K2RIH (20); K3ZO (19); W3YOZ (18); KA1SR (17); WB9HAD (16); KC5DX and VE3NNR (13); W0CEM, W4SEL, K6HNZ, and KF4HK (11).

Speaking of statistics, one of the highlights of the year is reviewing the 160-meter honor roll. This year we see some new records broken. Look at your state, province, or DX country. Do you recognize someone's call? Why not give him a run for his money in '87? Become a regional champion—earn your place on the 160 honor roll!

The 1986 contest found stations wall to wall on the band. Who will be the first to do 2,000 QSOs on 160? K1AR, how about you? Pssst, N2AA, are you anxious to try? Is 2,000 even possible?

Table 3. 75-meter honor roll—all-time record holders. (Columns show QTH, callsign, year, and score, respectively.)

YV5BHW, the 75-meter single-op DX champion.

IK4CFV, the 75-meter multi-op DX champion.

NR5M, K3TUP, IK4CFV, and YV5BHW —75-Meter World Champions—

The dust has settled and the entries are in. George NR5M and John K3TUP are the undisputed World Champions for 75-meter phone. Attaining nearly 1,100 QSOs, their multiplier counts were their trump cards, each surpassing their second-place rivals by 17 DX countries! NR5M, a single-op station, earned 1,087 QSOs, 58 states and provinces, and 42 DX countries. K3TUP made 1,097 contacts, 59 states and provinces, and confirmed 55 DX countries. By the way, this is John's second 75-meter Championship in a row. He is also 3-time World Champion on 40 meters. Awesome! It's obvious who the competition is. Congratulations, fellas!

Gustavo YV5BHW took first place to become World Champion for single-operator DX stations. In the multi-operator category, IK4CFV dominated the band by outscoring second-place station HK1SC nearly two to one. You both did a great job. Hats off to these World Champions!

Did we see the world QSO record broken? No, not this time, but we did see a few slots in the top ten list changing hands from last year:

Single Op:

N7DF	1985	1,265
K4JPD	1985	1,153
NR5M	1986	1,087
N7DF	1984	1,076

Speaking of records, gander at the 75-meter Honor Roll list. We saw some new calls breaking or establishing records. Gives you an incentive to turn out for next year's contest, doesn't it?

For a 24-hour contest, especially on 75-meters, can you imagine making all those contacts? Insomnia? Wonder how many stations slept through the day Sunday?

Stations with 500 contacts or more included: K3TUP (1,097), NR5M (1,087), WB9HAD (1,053), W8LT (876), KS3F (837), N4KMY (822), KS9O (808), N8CXX (804), NK7U (800), VE5RA (760), VE7AV (653), K5MR (639), KQ3V (600), W1WEF (529), and IK4CFV (520).

In the past, Canadian multipliers have been a holdout. This year all states and provinces (48 states and 13 provinces) were heard and worked on the band. Turning in totals of 50 or more W/VE multipliers were: VE5RA (61); K0HA and N8CXX (60); K3TUP, N4KMY, and VE4ALO (59); NR5M, W8LT, KS9O, WB9HAD, and KQ3V (58); KS3F, VE7AV, and KC8P (57); NK7U, K5MR, KB3A, and K8HVT (56); KA5VUU and W4WKQ (54); WA1UJU and KB8KW/7 (53); W4TMR, W1WEF, K3ZO, KN1M, K7LXC, and WA6FGV (52); KD0OZ and KY1H (51); KA1SR (50).

The DX country count was very good for 75! Of course, the East Coast stations had a sizable turnout of European stations while the West Coast had very slim pickings from Asia and the South Pacific. Stations achieving 25 or more DX countries include: K3TUP (55), NR5M (42), IK4CFV (40), W8LT (38), KS9O (34), K5MR (31), K3ZO (28), N8CXX (27), and K0HA (25). On the West Coast, NK7U had the most DX countries worked with 19, followed by VE7AV with 17; K7LXC and KL7U confirmed 14.

75 meters and 160 are the two bands most vulnerable to high noise levels. Being able to receive a station is much tougher than trying to be heard. The hunk of wire you put up, its height above ground, the direction it is strung; with verticals, how it is fed, how it is cut (wavelength), whether it has radials or not, all are determining factors that must be considered if you expect to be a championship station on this band. So what attempts are made by our participants? From the results, here's what the breakdown looks like, showing the antennas used in the 75-meter contest and their percentages:

Inverted vee/dipole	40.0
Vertical	16.3
Quarter-wave sloper	8.7
Delta loop	7.6
Phased verticals	6.2
Inverted "L"	5.0
Half-wave sloper	5.0
Longwire	3.7
Wire beam	2.5
Bobtail curtain	2.0
Zepp	1.2
2-element yagi	1.0
3-element yagi	.8

Table 2 takes you a step further and shows you how all these statistics equate to what the top-ten stations were actually using on the air.

As we get ready for the 1987 contest season, all stations are reminded to observe the DX window from 3.790 to 3.805. For contest purposes, *the contest rules state that the DX window is for split-frequency operation only!* This means DX stations will only transmit and W/VE stations will only listen in the DX window. Two-way exchanges within the window, regardless of whether you are DX or W/VE, will result in your entry being disqualified. Unfortunately, this year a few stations were victims of this stipulation. We regret this action, but the integrity of our Championship events requires we not deviate one iota from the rules. Using the DX window as it was intended will mean more DX for us all!

Ron Johnson KC7PA, our 75-meter Contest Chairman, and I thank you for your participation. The season has been exciting. Congratulations to our state, provincial, and DX country winners. See you all this coming January.■

OUR CHRISTMAS STORY

Sometimes a writer must search long and hard for a story to fit the holiday season. The easy way out is to simply report on all the new gear to be found "under the tree." That is, if your Christmas tree happens to be over the operating position in your ham shack. But, there is a lot more to the holiday season than a new hand-held or an HF transceiver. The holiday season is really a time for a new beginning. At least it's been that way in my life, and I'll bet it's been that way for many of you as well. So, keeping this concept in mind, I began searching for something apropos. As it happened, the material I was looking for had been right under my very nose since late last summer. It comes from the well-respected Southeastern Repeater Association's *Repeater Journal*, and was originally authored by Wayne C. Williams K4MOB. I have taken some slight liberties in revising the text to fit the national/international format of *73*, but I hope that you will feel as moved when you read it as I did. Here now is *73* Magazine's "Christmas Story."

A Portrait of Petie

The Sunday morning Radford, Virginia, *News-Journal* had the big headline: "PETIE AWAKE—SMILING AND WANTING A COKE." For those who had been following the life drama of Michelle "Petie" Lineberry, this was wonderful news.

Petie had just received a new heart from an unidentified Dallas, Texas, donor. The transplant operation had begun at 6:15 a.m. on Friday, June 13. Now, on Sunday, she was doing "very well" in the cardiac intensive care unit at the Medical College of Virginia.

Petie is the 20-year-old daughter of Bill Lineberry WB4TGT of Radford. Her problems began about two years ago when she visited the doctor because of a stubborn chest cold. They found a murmur in her heart. A year later, another visit determined that her heart was beating in an erratic pattern and fluid was building up in her lungs. At the Medical College of Virginia, they found that one side of her heart was completely dead. The muscles were not pumping, just wiggling.

Despite this, Petie went back to Radford University and maintained a B average, finishing the spring semester. Her condition continued to deteriorate, and she was admitted to the hospital in Radford, and then transferred to MCV. The prognosis: Petie needed a new heart. The search for a suitable donor started.

In June the donor was found; Petie received her new heart and is still recovering nicely. But, her troubles are not over. For the rest of her life, Michelle will be saddled with a $1,200-per-month anti-rejection medication bill. Unfortunately, WB4TGT had been laid off by AT&T just prior to Petie's operation, and hospitalization insurance was lost. Bills from the operation have exceeded $100,000 and, as already noted, will continue to build at a clip of $1,200 a month.

To try to help Petie and her family cope with these monumental expenses, a committee was established by interested friends in Radford. It's called the "Chance for Life Committee," and it has been conducting all sorts of fundraising events in the town to help out. Due to the enormous amount of money that needs to be collected, help is being sought from every possible source.

Enter Ham Radio

Bob Cecil WA4LNT has now started a campaign through amateur radio to help out his friend and fellow amateur WB4TGT and Petie. He asks that any or all hams nationwide who would like to help out to contact him. In addition, donations can be sent to Bob and he will forward them to the "Chance for Life Committee" on behalf of the amateur radio service. Clubs, repeater groups, and hamfest chairmen are also urged to find ways to join this drive to collect funds for this worthy cause.

In preparing this holiday column, I called Bob on October 11 to get an update on how Petie and her dad were doing. In one of those truly rare quirks of fate, at the time the phone rang at Bob's house, he was on the air and in QSO with Bill Lineberry WB4TGT. Only a few moments earlier, Bob had spoken with Petie and had learned that the doctors handling her case were amazed at the recovery. Right now, those very expensive anti-rejection drugs are doing their intended job and as a result, Petie is not only back in school, but she is also into a teaching work program where she holds classes twice a week—one day on the University campus and another at an outside grade school. She is majoring in child psychology, and doing quite well with her studies.

There has been some good news about her dad as well. Bill has found employment with an automobile dealership, and things are looking up a bit for the family. But, there are still the medical bills—the $1,200 a month for anti-rejection medication that will be with Petie for the rest of her life.

"The $1,200 a month for anti-rejection medication will be with Petie for the rest of her life."

As I write this, a thought occurs to me. There are currently about 450,000 licensed amateurs in the United States. If each one of us gave Petie's "Chance for Life Committee" a one-dollar donation, that would bring in close to a half-million. It could also mean that Petie need never again worry about the costs related to her illness.

Heart disease is a very expensive illness to suffer from. I know this firsthand, since I too am afflicted by it. Less than two years ago, I was a candidate for bypass surgery, but a new miracle drug has at least temporarily brought my problem under control. Obviously, I am far luckier than Michelle "Petie" Lineberry, but I too pay a high price—both financially and psychologically.

So, how about it, guys and gals? We pride ourselves on our dedication to public service. What better service can we hams collectively perform than to help to insure a life? How about we amateurs putting our monies where our mouths usually are, and collectively adopting Petie and her problems as a symbol of the one-on-one public service aspect of what ham radio is really all about? My few bucks are already in the mail. How about yours? Donations should be sent to the "Chance for Life Committee," c/o Bob Cecil WA4LNT, New River Valley Amateur Radio Club, Inc., Drawer 1127, Dublin VA 24084. No pun intended, but this is a topic that is personally very close to my heart.

HAM RADIO GIFT TAPES

I cannot close this month's column without making reference to one of the few tangible holiday gifts "that keeps on giving." Videotapes. You do not have to be a ham to enjoy them, but you do need to own a VCR. Beta or VHS. First, a presentation from one of the major studios. More accurately, you might say that it's a gift from a ham radio operator to the world, although you will have to pay to get a copy. The ham I am writing about is Jean Shepherd K2ORS. I first met Jean when he was still doing his late-night talk program on WOR radio in New York. Unlike the phone-in programs of today, "Shep" relied on his own abilities as an "observer of our times" to keep an audience "glued to its Emerson" for hours. Jean is the only radio host I know of who could make you enjoy listening to a commercial! After his WOR show, he could be found driving home and chatting with our "gang" on the old WA2SUR repeater.

In the 1970s, K2ORS hosted a little-known ARRL "video" titled "OSCAR And The Ham." I am still unsure of who produced and directed it, but it did explain the ways in which the second generation of OSCAR satellites could be used as an educational tool. Why the ARRL never exploited it the way they did films like "Hams' Wide World" or "Moving Up To Amateur Radio" is something I'll never understand. Maybe it was because "OSCAR And The Ham" was done on the then-new medium of videotape, and tape was something with which the ARRL was unfamiliar.

Jean has also been the featured banquet speaker three times at the Dayton Hamvention, and in 1985 I was able to corner him to record some public-service spots about ham radio. We did them on videotape, but at the time we had no way of knowing that the camera had malfunctioned. Since the audio was unaffected, they were

converted to radio spots by Lenore Jensen W6NAZ and sent off to ARRL HQ for distribution.

Anyhow, a few years back, Jean grabbed a jet out here to Hollywood, and with the folks at MGM/United Artists, he created the modern "Christmas Folk-tale." It has the simple but very apropos title of "A Christmas Story" and is based on his earlier best-selling book titled *In God We Trust—All Others Pay Cash.* If you have seen the film, then you already know what I mean. If not, go out and treat the family to something very special. It's a tape you will want in your collection, and an experience that will last a lifetime. Try any good video store to purchase a copy.

Another tape that you might want to have in your collection is "SAREX—The Shuttle Amateur Radio Experiment." Not because it tells the story of manned ham radio and ham TV in space, but rather as a lasting tribute to a truly valiant space machine that was known as the *Challenger*. The second amateur radio space operation flew on the *Challenger* in July of 1985. *Challenger* had only one other successful launch—Flight 61-A—before the accident that caused its destruction and the loss of its seven-person crew earlier this year. But the 61-A flight was never chronicled in as public and in-depth a way as was the "Ham in Space" 51-F mission. So, in essence, Roy Neal's ARRL video "SAREX—The Shuttle Amateur Radio Experiment" stands as a lasting and living testimonial to a truly proud space machine and to the many men and women who flew on her. You can purchase a copy on VHS for $25 from the ARRL, 225 Main Street, Newington CT 06111. They do not supply it in Beta format, but as one of its producers, I have a dub-master and will gladly fill any Beta II or Beta III orders as a not-for-profit service for the same price.

I wish you all the best of Seasons Greetings from those of us who write the late shift, here in the City of Angels.■

SYNTHESIZED
SIGNAL GENERATOR

MADE IN USA

MODEL SG-100F
$429.95 delivered

• Covers 100 MHz to 199.999 MHz in 1 kHz steps with thumbwheel dial • Accuracy +/- 1 part per 10 million at all frequencies • Internal FM adjustable from 0 to 100 kHz at a 1 kHz rate • External FM input accepts tones or voice • Spurs and noise at least 60 dB below carrier • Output adjustable from 5-500 mV at 50 Ohms • Operates on 12 Vdc @ ½ Amp • Available for immediate delivery • $429.95 delivered • Add-on accessories available to extend freq range, add infinite resolution, AM, and a precision 120 dB attenuator • Call or write for details • Phone in your order as fast COD shipment. ↙79

ALL BAND TRAP
"SLOPER" ANTENNAS!

FULL COVERAGE! ALL BANDS! AUTOMATIC SELECTION with PROVEN Weatherproof sealed Traps - 18 Ga Copperweld Wire! GROUND MOUNT SLOPERS - No Radials needed! Ground to rod or house water faucet! Connect Top to Tree, Building, Pole, etc at ANY angle from Straightup to 80 degrees for excellent "SLOPER" DX Antenna Gain or bend it anywhere you need to! 2000 Watt PEP input, max. Permenant or portable Use Installs in 10 minutes. SMALL - NEAT - ALMOST INVISABLE - No one will know you have a Hi-Power DX Antenna. Ideal For CONDOs APARTMENTS- RESTRICTED AREAS - Pre-tuned for 2-1 or less SWR over ALL bands (except 80-160-300kc) No adjustments needed - EVER. COMPLETELY ASSEMBLED, with 50 ft RG-58U Coax feedline and PL259 connector - Built in lighting arrester - ready to hookup! FULL INSTRUCTIONS!

No. 1080S - 80-40-20-15-10 — 1 trap 49 ft.— $59.95
No. 1040S — 40-20-15-10 — 1 trap 26 ft.—$56.95
No. 1020S — 20-15-10 — 1 trap 13 ft.—$57.95
No. 1018 S-180-80-40-20-15-10 – 2 traps 83 ft. – $89.95

Crystal Filters

YEAR-END CLEARANCE

All starred (★) items 20% off; all others 10%. Prices are *each* except as noted. All filters 8-pole. Sale ends December 31, 1986.

FILTERS FOR KENWOOD - Reg. $60 except as noted.
8.83MHz IF for models: TS120 through TS940
Bandwidths: 250, 400, 1800, ★ 2100, 6000Hz
TS440 ★ Pair (400 Hz CW, 2.1KHz SSB) . . . . Reg. $120
TS430 ★ Triple (Both above plus AM) . . . . . Reg. $180

455 KHz IF for R820, TS830/930/940 . . . . . Reg. $110
Bandwidths available: CW 400HZ; SSB ★ 2.1KHz

Matched Filter Pairs for Above . . . . . Reg. $170 pr.
(8.83mhZ and 455KHz) SSB: ★ 2100Hz, CW: 400Hz

3.395MHz IF for TS520, TS511, R599.
Bandwidths Available: 250, 400, ★ 1800, 2400Hz

Filter Cascade Kits with Filter and Amplifier
For ★ TS430 $85, ★ TS520 $80, ★ TS820 — Reg. $80

FILTERS FOR YAESU . . . Reg $60 except as noted.
3.18MHz IF for FT-101 Series except Z/D.
BWs: 250, 500Hz, 1.8, ★ 2.1, ★ 2.4, ★ 8.0KHz

8.2 MHz IF for FT-102, FT-757/767.
Bandwidths Available: ★ 250, 500, 2100Hz
454KHz IF for FT-102 (★ 250, 500Hz) . . . . . Reg. $75
455KHz IF for FT-102 (★ 2.1KHz) . . . . . Reg. $110

8.9MHz for FT-101ZD/107/707/901-2. FT-980.
BWs: 250, 500Hz, 1.8, 2.1, ★ 2.4, 8.0KHz
10.78MHz IF for all but 980: BWs: 1.8, ★ 2.1KHZ
455 IF for FT980 only: BW ★ 2.1KHz . . . . . Reg. $110
455.8 IF for FT-980, FT726: BW ★ 500Hz . . . Reg. $75

Filter Cascade Kits with Filter and Amplifier
For ★ all 8.9 above except FT-980 . . . . . Reg. $80

9.0MHz IF for Tempo I (or FT-200), FT-301, FT-7/B
BWs: ★ 250, 500Hz, 1.8, ★ 2.1, 2.4, 6.0KHz
NOTE: Above are our "homebrewers' favorites"!

FILTERS FOR ICOM (exact replacements)
455 IF for IC730/740/745/751. R70/71. etc.
Bandwidths: FL44A (SSB ★ 2.4KHz) . . . . . Reg. $110
FL52A (500Hz); FL532 (250Hz) . . . . . Reg. $85 ea.

FILTERS FOR HEATH - ALL MODELS . . . . . Reg. $65
Bandwidths Available: 250, 400Hz ★ 1.8, 2.1KHz
For SB-104 Only: ★ 400HZ (3395.7 IF)

FILTERS FOR DRAKE R-4C . . . Reg. $65 exc as noted
GUF1 (8KHz) Replaces original 1st IF 4-pole unit
GUF2 (800Hz) Switches out GUF1 in CW . . . Reg. $100
2nd IF 125 ($75), 250, 400Hz, 1.8, ★ 2.1, 6KHz

FILTERS FOR DRAKE TR7/R7, etc. . . . . Reg. $65
BWs Available: 250, 400Hz; ★ 1.8, ★ 2.1KHz

FILTERS FOR COLLINS 7$S-3B/C ★ 250Hz Reg. $125

LIMITED QUANTITIES - ORDER NOW!
SPECIFY: Make and Model Number of your Rig.
Frequency and Bandwidth of filter(s)
ORDER by Mail or Phone — VISA/MC or COD OK.
SHIPPING: $5 US and Canada, $12 elsewhere.

You've earned your Ham ticket.
Now What?

Now you're ready to get on the air but you're not sure about how to actually install that antenna; or how to solder a PL-259 connector; or how to properly ground your station; or identify unknown transistor leads; etc.

Here's the perfect companion for exploring the more practical aspects of the world's greatest hobby.

The new Heil Ham Radio Handbook was written by the 1982 Radio Amateur of the Year-Bob Heil, K9EID. Bob heads his own electronic manufacturing company and is respected world-wide for his sound systems, microphones and equalizers.

Bob's new book fills the gap that often makes the difference between sitting there watching the dial lights and actually making contacts that are the real joy of amateur radio.

This book doesn't stop at the intermediate level however; you'll find handy hints no matter how long you've been licensed, and unlike other publications you won't need a PhD in engineering to understand the material.

It's a money-saver too—you can make your own 5amp 12VDC power supply at 1/3 the cost, as shown in this handbook, from parts you may have on hand.

In fact, once you own and start using this Handbook you'll wonder why "somebody" didn't publish it sooner! And the sooner you send for it, the sooner you'll be enjoying more aspects of Amateur Radio . . . . Send $9.95 (plus $1.00 shipping) directly to:

VIDEO FORMATS

This month I am going to take a look at the basics of weather satellite video formats. One of the things that greatly simplifies the design of a weather satellite station is that all direct-broadcast satellites, be they polar orbiters or geostationary spacecraft, employ the same basic video modulation format. Although the rf modulation of these satellites is FM, the actual video signal transmitted in this fashion is an AM-modulated audio tone. The audio tone or subcarrier is typically 2,400 Hz or something very close to that value, a subject I will return to briefly at the end of this discussion. The modulation "sense" is such that minimum subcarrier amplitude corresponds to black, while maximum amplitude represents white.

Fig. 1 shows a diagram representing the detected and filtered subcarrier during one line of transmission of a hypothetical 16-step grayscale. The grayscale begins with black on the left and ends with white on the right side of the display. The white level (100% amplitude) is arbitrarily set at +5 V. Note that the black step is *not* 0 V (no subcarrier). With most spacecraft, assuming the modulator is operating properly (see discussion later), the black level will be about 4% of the peak white level or about 0.2 V with a +5-V peak white value.

The dynamic range of this signal, measured from 4% black to 100% white, is thus about 26 dB. This implies that the signal-to-noise ratio should be at least 26 dB, and preferably a little more, in order to have a "noise-free" video signal. As the amplitude of the noise increases relative to the video signal, the effect will first be noted as "snow" in the black end of the dynamic range. As noise levels increase, you will eventually reach a point where only the whitest portions of the image will peak above the noise threshold. There are two principal ways to increase the signal-to-noise ratio and lessen the impact of noise on your final display. The first involves optimizing the rf end of the system in several ways:

1) Maximizing antenna gain. Ignoring the negligible impact of solar and galactic noise, increasing the gain of the antenna provides basically "noise-free" gain.

2) Use of a low-noise front end.

3) Matching the i-f bandwidth to the signal bandwidth, a subject I discussed last time.

Assuming you have done everything possible at the rf end, some judicious audio filtering can be applied to reduce the impact of noise falling outside of the 2,400-Hz video passband. This is more complicated than simply putting a sharp 2,400-Hz bandpass filter in the video line because the AM-modulated 2,400-Hz tone has sidebands just like any AM signal and these must be passed in order to recover the video modulation with minimum distortion. Relatively low Q active filters, centered on 2,400 Hz with a bandwidth of about 1,600 Hz, work well in practice.

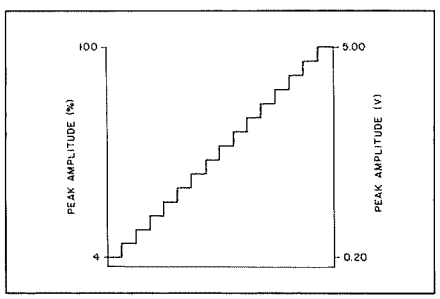

Fig. 1. Diagrammatic representation of a detected and filtered subcarrier signal modulated by a 16-step grayscale. The grayscale steps run from black on the extreme left to white on the extreme right. Output amplitude has been arbitrarily scaled to +5-V maximum. Note that while white represents maximum subcarrier amplitude (100% per 5 V), black, while minimum, does not go to zero. Black is normally about 4% of peak amplitude, corresponding to 0.2 V on the scale above.

Basic Signal Conditioning

Your basic weather satellite video system involves a video detector and post-detection filter to recover the modulated waveform in a form similar to that illustrated in Fig. 1. The filtered video output voltage is then used to control the display in one of three general ways:

1) Modulate the intensity of a CRT scanning beam in the case of a CRT (cathode ray tube monitor).

2) Control of the voltage on a printing stylus or the intensity of a glow modulator tube for facsimile printing.

3) A/D (analog-to-digital) conversion of the detected waveform for scan converter display.

Regardless of how we are going to use the video, it is obvious that an AM system of this sort is going to be amplitude sensitive. Any display system will require some sort of gain or contrast control so that the peak subcarrier amplitudes will reproduce as white while the minimum (4%) amplitude will come out black. Anything that changes the peak white amplitude in your system will result in a need to readjust such a control. Such readjustment can be tedious unless you use a scope to look at the video waveform, so we would like to minimize such peak amplitude variations as much as possible.

Unfortunately, there are lots of links in the system where such variation can occur. One of the more obvious sources, if you are recording pictures with tape, is variation in recording levels and audio output levels from your tape deck. This problem can be minimized by using a constant record and output level setting, preferably a combination that results in the same peak level that you would normally get directly from your receiver.

A second source of amplitude variation comes from the receiver in ways that are not inherently obvious. At this point, those of you who read my last column may be mumbling because I showed you how to install a constant output video tap from the top of the volume control. If we assume a constant gain from the rf, i-f, and audio stages, such a tap will always produce the same peak audio level at the output, given the *same* input signal. Unfortunately, even though the gain characteristics of your receiver may be quite stable, satellite input signals are rarely "the same," primarily due to differences in the deviation of the spacecraft transmitters.

Assuming your discriminator is reasonably linear, if your receiver will generate a peak output level of 1 V (a purely arbitrary value) with a fully modulated TIROS/NOAA signal deviating ±18 kHz, what do you think the results will be on a WEFAX geostationary signal that may be deviating ±10 kHz? The answer is about 0.55 V—10/18 x 1! If your display system is adjusted to display peak white with the NOAA signal, your WEFAX image "whites" will reach only mid-range gray values unless you increase the gain or contrast in the display system.

While any given type of polar-orbit spacecraft will usually be fairly similar in terms of signal deviation characteristics (similar, but not absolutely equal!), the peak signal levels recovered from the TIROS/NOAA satellites will be different from those recovered from a specific type of Soviet METEOR spacecraft, which in turn may differ from other experimental METEOR or COSMOS satel-

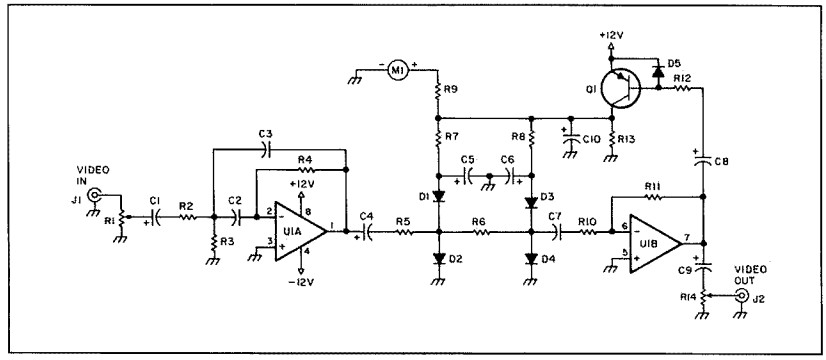

Fig. 2. Schematic of the satellite video pre-filter and agc unit. Parts values are provided in Table 1.

U1	MC1458 dual op amp
Q1	2N4403 (general-purpose PNP audio)
D1–D5	1N914 or other general-purpose diode

Resistors: Unless otherwise noted, all values are in Ohms; everything except the pots are 1/4-W, 5%, metal film or composition.

R1	10k PC pot (AGC THRESHOLD)
R2, R7, R8	10k
R3	2700
R4	20k
R5, R6	4700
R9, R13	47k
R10	1000
R11, R12	120k
R14	10k PC pot (GAIN)

Capacitors: Unless otherwise noted, all values are in uF: M = mylar (100 V), T = tantalum electrolytic (16 V min.), A = aluminum electrolytic (16 V), and D = disc ceramic (50 V).

C1, C4, C8, C9	1 T
C2, C3, C7	0.01 M
C5, C6	22 T (6 V)
C10	100 A
C11, C12	0.1 D
J1, J2	RCA phono jack
M1	50-microamp panel meter (agc), available from Radio Shack

Table 1. Video filter/agc parts.

Date	01 December 1986	
Spacecraft	NOAA-9	NOAA-10
Orbit Number	10137	1058
Eq. Crossing Time (UTC)	0045.87	0125.43
Longitude Asc. Node (Deg. W.)	148.55	88.87
Nodal Period (Min.)	102.0638	101.2979
Frequency (MHz)	137.62	137.50

These orbital parameters are projected two months in advance due to deadline considerations. Accumulated errors due to uncompensated orbital decay and other anomalies result in expectation of errors up to two minutes and possibly as many degrees in terms of the crossing data and possible small changes in the indicated period. Users requiring precision tracking data should rely on more current sources.

Table 2. TIROS/NOAA orbital predict data.

lites. WEFAX deviation levels can differ significantly, even from the same spacecraft, since the output signal on the WEFAX downlink simply mirrors the uplink signal, which is subject to both ground equipment and operator foibles.

Most of this unavoidable variation can be minimized in any display system by the addition of automatic gain control (agc) prior to video processing. Fig. 2 shows a simple front-end circuit to accomplish this with the added bonus of pre-filtering of the video signal.

U1A is one section of a dual op amp wired as an active audio bandpass filter. The circuit has unity gain, a center frequency of 2,400 Hz, and a bandwidth of approximately 1,600 Hz. Placing this filter at the input of the circuit module provides two functions. The first is the obvious one of minimizing the effect on the display of noise outside of the video passband.

The second function is to minimize the effect of noise on the agc section that follows. The output of U1A is routed through a two-stage diode attenuator consisting of four 1N914 diodes (almost any diodes will do as long as they are all the same type). The attenuation level in this network is directly proportional to the dc control voltage applied to the two 10k resistors, a subject I will return to momentarily. The output from the diode attenuator network is applied to the input of U1B, an op amp with a fixed voltage gain of about 120. The output of this amplifier drives a PNP transistor, which functions as the agc detector, producing a control voltage on the collector.

Relatively high drive from U1B will produce a higher control voltage on the collector than a low-drive condition will. This control voltage, when applied to the diode attenuator network through the two 10k resistors, effectively controls the attenuation level of the network that provides the drive to U1B.

Should the input peak signal level increase, the output from U1B will increase, causing an increase in the control voltage at the collector of Q1, and this will cause an increase in the attenuation of the diode array, reducing the output from U1B! Similarly, if the peak amplitude at the input decreases, the output from U1B will fall, reducing the agc control voltage, which in turn reduces the diode attenuation, causing the output of U1B to increase.

In effect, the peak output from U1B, which provides the drive for your display system, is in dynamic equilibrium, maintaining a very constant peak output level despite variations in peak input level. The input RC network to Q1 controls the attack time of the agc system (essentially fast), while the components in the collector of Q1 set the decay time constant (relatively slow). The values shown provide effective agc action without "pumping" in response to the video modulation waveform. M1 is a 50-microamp panel meter that monitors the agc control voltage and provides a visual indication that you are within the linear agc control range.

Construction

Construction of the pre-filter/agc module is quite straightforward and can be done using perfboard. Common sense dictates a reasonably compact layout, particularly around the diode network and the agc amp. I don't know what the "outer limits" are in this regard, but I have duplicated the circuit many times with no problems.

Only a few things are critical enough to triple-check! The first of these is the polarity of the agc diodes. The second concerns the basing of Q1. Note that this is a PNP device and the emitter *must* go to +12 V. Put it in backwards or use an NPN unit and you will have problems. The final point concerns the tantalum capacitor in the base lead to Q1. Note that drive is applied to the negative lead of the cap with the positive lead going to Q1. You must observe this orientation or the circuit will not work!

Setup

Preset R1 (AGC THRESHOLD) and R14 (GAIN) so that the center arm of both pots is at ground (minimum gain). Connect the output of the receiver to J1 and set the receiver to an unused channel so that the unit is driven by noise. When you apply power, the agc meter (M1) should bounce up to full scale and then slowly decline to zero. If the unit pegs at 50 microamps, turn off power and check the installation of C8, Q1, and D5.

Slowly advance R1 until the agc meter indicates a reading of 15. At this point, the GAIN control should be adjusted to the desired output level. An audio amplifier, connected at J2, should yield an undistorted version of the original signal. The best way to check this is with a modulated satellite signal. With a modulated signal at the input, the agc meter should read about 15—retrim R1 if this is not the case.

Use

In use, the module is simply placed between your video source (receiver, tape, etc.) and your normal display system. All of your sources should produce an agc meter reading of between 10 and 20, indicating the linear portion of the agc range. It is best to set the AGC THRESHOLD control as indicated and then adjust the gain of other sources so that they fall into the 10–20 range. Output gain can be set to any convenient value to drive your display. The most convenient level, assuming you have already optimized your display contrast, is a peak level that corresponds to what you used to get directly from the receiver. Not only will this module provide desirable filtering, it will also virtually eliminate knob twiddling when switching from one spacecraft or video source to another!

Subcarrier Frequency

I have previously noted that the video subcarrier frequency is at or close to 2,400 Hz. In the case of all

U.S. spacecraft, the frequency is precisely 2,400 Hz and the subcarrier signal can serve as a frequency reference for the display timebase. *Some* Soviet spacecraft have their subcarriers precisely locked, but most operational 120-line/minute METEOR spacecraft do not.

In general, it is probably not desirable to lock your display to the subcarrier as a frequency reference. The only advantage to this technique is that it makes possible the use of a monaural tape system for recording. On the minus side, the technique does not work with all Soviet spacecraft, it is subject to loss of frequency lock with signal fades, and, finally, it is not as versatile a timebase standard as we really want! If we go to an external timebase, we must use a stereo tape system for recording, but this is a small price to pay for the versatility we will get by going that route.

Earlier I made reference to the fact that the "normal" black level is about 4% of peak subcarrier amplitude. In some cases, ground equipment problems will result in a condition where WEFAX signals will go to 0% amplitude on black. This loss of subcarrier can disrupt the phase-lock time base, causing a progressive loss of image sync. A similar condition occurs during severe storm operations where the high-resolution VISSR signal is transmitted along with the WEFAX signal, causing repetitive dropouts that will cause a loss of subcarrier sync-lock. Thus, although the WEFAX S-band signal would appear ideal for a subcarrier-locked sync system, since fading does not occur, even this format has problems that limit the usefulness of locking to the subcarrier.

Photo A. An early winter storm in the process of burying the Great Lakes area. The image was obtained from an afternoon TIROS/NOAA pass in visible light.

Picture of the Month

This particular picture is quite seasonal in that it shows an early winter storm in the process of burying the Great Lakes area. The image was obtained from an afternoon TIROS/NOAA pass in visible light. The pass was automatically recorded using the "Zapper" omnidirectional antenna from the *WSH*. Lake Winnipeg shows through a bit of noise at the top, just left of center, while James Bay and a bit of Hudson Bay are visible just to the right of top center. All of these bodies of water, and most of Lake Superior, visible just above the center of the image, are ice-covered, but the lower Great Lakes, of which a bit of Lake Michigan and Lake Huron are visible, are still ice-free. Two fronts are stacked along the Appalachians in the lower right. Visible in the original, but probably missing in this reproduction, is a bit of the Mississippi River system slightly to the left of center along the bottom of the picture. The picture was printed on the direct-printing FAX recorder described in the *WSH*.

Note

References to the *WSH* refer to the Third Edition of the *Weather Satellite Handbook*, available from the author for $12.50 postpaid in the U.S. and Canada and $14 elsewhere.

Next Time

In my next column, I will look at the various sorts of timebases that are required for a satellite station.■

ATV

Number 13 on your Feedback card

Mike Stone WB@QCD
804 Jefferson Avenue
Lowden IA 52255

Direct reader response mail to my home address has been very good, indicating that there is a lot of new (and old) interest in the ATV modes. I will try to answer as much mail as possible. Always include an SASE with any correspondence. Most of your mail is asking: "Is there any UHF FSTV activity in my area?" and "What is the best equipment to build or buy?" and "How strong is color SSTV on the bands today?"

I have prepared a special informational packet of material that includes all 1986 USATVS State Section Manager listings and filed activity reports. This covers about 70–80% of the country and gives callsigns and names of ATV groups that will answer a lot of your questions and tell you who might be nearby to help you get started. To obtain this report packet, send me an SASE with an extra 22-cent stamp on it. Mark "USATVS 1986 Report Packet" clearly on the outside of the envelope.

Before I get technical in this month's column, I'd like to ask a simple favor of you all. Many of you old-timers on ATV (FSTV and SSTV) have been complaining about "lack of coverage" by some of the leading national amateur radio magazines. W2NSD/1 and KW1O have now given us this great opportunity via this column! A regular monthly column on this mode is a service to those who have not yet tried out the FUN of ham television. *We need to receive your responses!* Please take a few moments to fill out the Feedback response postcards in each issue. Let *73* know that you are indeed reading this column with great interest, and tell them what your favorite articles and columns are each month, so they will continue for a long time!

FSTV Possibilities

What types of TV pictures are transmitted by fast-scanners? Is the sending of commercial movies legal? Does sound accompany the picture as on commercial TV?

Perhaps the most common and enjoyable TV pictures sent on UHF ATV are from one-on-one QSOs in the shack. There is your ATV friend—across town, a few cities away, or maybe over a distance of several hundred miles out of state—sitting in front of the camera, looking right into your eyes, and "talking" with you! "Here's the latest circuit board I am building, John," says an ATVer as he does a zoomed close-up of the device. "Here come the XYL and the kids and they have taught Rover a new trick tonight to show you. Stand by!"

Many times, with the popularity of VCRs, home movies are sent. Other possibilities include vacations, Field Days or special events, lectures and talks, DX band-opening accomplishments, on-the-air tests, parades, air shows, and so on—the field is unlimited. No, commercial movies are illegal to send over ATV, so file that copy of "Star Wars" away for another galaxy.

Sound does indeed accompany the video picture, and there are a number of ways to send it. I will get into that in a future column.

The uses of ATV are many. Our ATV group has put a man in a hot-air balloon and sent him aloft for great ATV pictures, set up two separate FSTV-transmitting stations on the rooftops of college buildings to give go-cart race coverage of hidden (potential trouble)

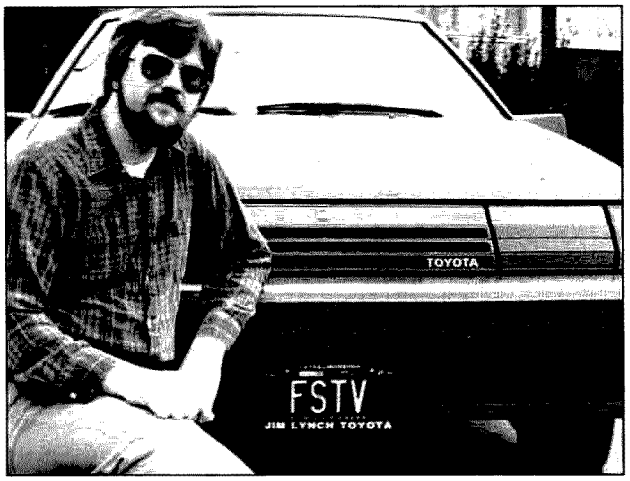

Photo A. Dave Williams WB0ZJP proudly proclaims his hobby on his new license plate.

Photo B. 325-mile ATV DX received by WB0ZJP in St. Louis, Missouri.

areas to officials, went on wintertime "hidden video transmitter" hunts with ATV-equipped mobiles, equipped an Air National Guard helicopter with color FSTV gear for some exciting aerial views of our area, and much more!

The Hillsboro, Illinois, ATV gang likes to shoot local parades and pipe the narrated coverage with "on-the-street reporters" into a large nursing home/hospital complex. Washington, D.C.'s Metrovision ATV group (and a number of others in the U.S.) tracked all the Space Shuttle flights, with 24-hour raw video displayed on each mission. Southern California ATVers cover yacht races, the famous Pasadena Rose Parade, and a number of other public events.

ATV repeaters can really get fancy with independent remote transmitter mode positions, which can include touchtone™ screen displays, such as color bars, live feeds, computerized graphics, security cameras, RTTY/packet/AMSAT window feeds, interactive game ports, SSTV feeds, Morse-code mode-testing displays, VCR replays, and so on. Once you become an "active member" of an ATV group, you'll find a whole new world out there full of experimentation, testing, building, education, friendship, and fun.

The Cheap Way to Do It

While I was writing this column in late September, my buddy Don KA0BVT in Moscow, Iowa (whom I got started on FSTV about seven years ago), was attempting a new experiment. I sent him my UHF TV video picture of the shack at about 100 Watts of power, while he tried to receive me direct with no interfaced downconverter on his new cable-ready VCR. The distance between us is about 25 miles over very hilly terrain.

His two 88-element and my four 48-element Jaybeams (along with power) normally will give a P4-to-P5-picture signal level. He saw a good picture of my signal just by tuning below channel 14 on his VCR UHF tuner with his ATV beams being connected to the UHF TV connector! The signal level was about P2 (locked and readable). Then he took his Advanced Receiver Research preamp and added it in-line. My signal was now a rock solid P4 with very little noise! *No downconverter*—just straight UHF tuner receive!

You can try the same thing on today's solid-state TV sets. Some will slide tune down below channel 14 (470 MHz) and catch 430 to 440 MHz. Few go much lower without modification. With the purchase or construction of a good high-gain UHF antenna (and maybe a preamp), this method, although not recommended as a permanent setup for viewing FSTV in your area, might just be a cheap way to try seeing ATV activity! Coordinate your viewing times with those who can transmit a picture to you. You need to know where the video troops are hanging out on 2-meter FM (this information is also included in the SASE package).

Antennas for UHF ATV

ATV manuals will talk about a number of UHF-style antennas that can be used for FSTV operations. Skeleton Slot and yagi antennas are popular, and K2RIW designs (cut for ATV) are beginning to take over third place—but the two multi-element beam arrays that stand out among all others are the 27-element KLM and the English-made Jaybeams.

It is clear that wide bandwidth is needed for the sending and receiving of ATV pictures. Both KLM- and Jaybeam-manufactured products handle this requirement quite well—much better, in fact, than standard, narrower bandwidth yagi designs. The KLM model uses a series of crossed interfaced driven elements to achieve good results, while the Jaybeam relies on the bend designed into the elements.

Both antennas are comparable in gain. ATVers do not always go just for the highest forward gain in an antenna as do 432 EME/SSBers, for example. Transmitting and receiving the 3.58-MHz colorburst and the 4.5-MHz audio subcarrier sound signals are a must! Both models will handle all the power you can legally throw at them. KLM 6-, 14-, and 27-element beams are available at most dealers or via P.C. Electronics. The more popular Jaybeams can be ordered through John Beanland G3BVU/W1 at Spectrum International, PO Box 1084, Concord, MA 01742.

My preference is with the Jaybeams. I run a stacked quad array of 48-element models using a phasing harness. I would run the 88s, but the winds here in the Midwest just won't allow it. With 100 Watts of power, hardline, a mast-mounted preamp, and these antennas, my best summertime FSTV UHF DX has been to WB8ELK in Findlay, Ohio—over 400 miles away! I see P1 to P2 pictures or hear the carriers (on FM/SSB) from Chicago about 150 miles away just about any time I want to. It's taken a lot of work to get that sensitive! Locally out to 50 miles, pictures are usually P3 to P5 in signal strength with the preamp on. As stated earlier, do it right and it will work for you!

Low-Loss Coax Is a Must on UHF

Up until the past couple of years, Belden 8214 and Saxon 8285 coaxial cable were the minimum accepted models in FSTV circles, less, of course, the preferred use of 50-Ohm hardline. Today, Belden 9913 and International/Columbia 1180C are accepted as the best of the flexible RG-8/U-type coaxial cable runs to use on UHF. Loss is rated at around 2.5 dB per 100 feet at 400 MHz. Anything less than these models and you will lose more than one-half your transmitted and received signals. I can't emphasize enough how vitally important this can be. Unfortunately, it is usually the most neglected feature of the station.

Get the best that you can afford to buy, of course. Higher priced, double-shield stuff is not always the lowest loss on UHF. It was made primarily to keep rf out, not in. Spend that extra few pennies per foot for the best.

SSTV—To Go Color or Not to Go Color?

Nearly every hamfest flea market will turn up a number of good buys on older SSTV gear. The Robot Research Model 400 is still

a very sought after piece of gear. A few years ago, it sold for $795 and you were lucky to get one. Today, the black-and-white units can be found new for $300 or used for between $150 and $250. If you are interested in getting into SSTV but do not want to spend a large amount of money just yet, buy one. Many hams have converted them to color later on.

The units display a very clear picture of 128 pixels across (the little dots on the TV screen) by 128 lines down. Sixteen shades of gray are represented, although you usually can count only seven or eight. This piece of gear is a far cry from the days of P7 image display tubes when W2NSD saw his first boring SSTV pictures.

Bob Walker WB0VVY of Atkins, Iowa, made the conversion to color on his Robot 400 in a few nights with an upgrade kit supplied by Robot Research of San Diego, California. He now enjoys both black-and-white and full color (4,096 colors) SSTV pictures at 8-, 12-, 24-, 36-, and 72-second picture transmission and reception rates. True, the color is not quite as good and detailed as the more expensive top-of-the-line Robot 1200C converters, but then Bob doesn't have $1,300 wrapped up in it either.

If money is no object, then the 1200C converter right now is the way to go on SSTV. Robot Research has a neat four-page informative color brochure on these units. Write to them for details. I would say that about 70% of the SSTV transmissions today are being done in color. But seeing these pictures in black and white is still great viewing.

The pioneering efforts of G3NOX, VE3EGO, K6AEP, W9NTP, WB5MRG, DL2RZ, and others, and most notably those of KD6HF and WA7WOD, have brought color SSTV to what it is today. Some of the best ATV "experimentation" is taking place in the slow-scan ranks. Syd Horne VE3EGO's work in interfacing SSTV with packet radio for error-free pictures is going to be the next big step in SSTV. Tom Hibben KB9MC and Don Miller W9NTP are working together on putting out a "new" SSTV manual. It will be published by the League some time in 1987. There hasn't been a good handbook on SSTV for a number of years, and so much has happened since Don Miller, Ralph Taggart, and Dave Ingram K4TWJ wrote the last ones.

14.230 MHz is still the hot spot to tune in SSTV operations, but some DX is being heard again on 28.680 MHz. When 10 comes back in, be on the lookout for good low-power SSTV pictures once again.

W0ORE's SSTV pictures from the *Challenger* were very exciting for those who were equipped for watching, but wait until the manned space station project gets into orbit and nearly "live" SSTV pictures and perhaps "live" FSTV pictures are transmitted from above the earth. We are working with W5RRR at the Johnson Spacecraft Center ARC for this to become a reality. You will want to be part of it.

Cheap SSTV via the micro is possible at greatly reduced resolution. Dick Kinney of Kinney Software in Hamilton, Ohio, has a couple of versions of programs and interfaces for the CoCo and C-64 computers. I'd personally like to see IBM PC enthusiast Clay Abrams K6AEP take a relook at the new, higher resolution CoCo 3 computer with some of his former SSTV programs. Howard Nurse W6LLO of Commsoft has some very serious SSTV applications for Apple computers interfaced to CCTV cameras.

Whatever route takes you into slow-scan, the important thing is to get on and get your feet wet. If nothing else, tune into 14.230 early Saturday afternoon at 1800 UTC to the W1JKF/W9NTP SSTV net. Jump in, give your callsign, and tell Brooks or Don that you're interested in getting started on SSTV. They'll take it from there.

A Final Note

These first three columns have pretty much been basic material to get YOU, the newcomer, better acquainted with how fast-scan and slow-scan TV signals originate and are received, along with the types of programming sent over the air. Starting with my next column, I'll concentrate more on specific pieces of equipment, standards, and good operating techniques. More specifically, I'll talk about the camera, building FSTV repeaters, whether to use AM or FM, and a history lesson on SSTV development in the U.S. See you on the tube.■

FEEDBACK

In our continuing effort to present the best in amateur radio features and columns, we've decided to go directly to the source—you, the reader. Articles and columns are assigned Feedback numbers, which appear on each article/column and are also listed below. These numbers correspond to those on the Feedback card opposite this page. On the card, please check the box which honestly represents your opinion of each article or column.

"What's in it for me?" comes the cry from our faithful readers. Besides the knowledge that you're helping us find out what you like (and don't like), we'll draw one Feedback card each month and award the lucky winner a free one-year subscription (or extension) to *73*.

To save some money on stamps, why not fill out the Reader Service card, the Product Report card, and the Feedback card and put them in an envelope. Toss in a damning or praising letter to the editor while you're at it. You can also enter your QSL in our QSL of the Month contest. All for the low, low price of 22 cents!

PACKET POLL

Welcome to the first large-scale packet radio survey. Even the most incorrigible Luddites now agree that packet has made a significant impact on amateur radio in the 80s. We would be remiss in our duties to future historians if we did not try to record some of the demographics of the early days. Our future selves will no doubt look back at 1986 and laugh that we were still running at 1200 baud and were still shoving audio into the mike jack of our radios.

Please respond to this poll if you are on packet now or if you have been on at any time in the past and (gasp) dropped it. Feel free to not respond to specific questions.

I'd like to get most of the responses via packet (NK6K @ NK6K) or via CompuServe (71635,1174). You may also use paper; just cut out and mail the response form given below to the address given at the top of this column. I've asked that this column be printed with one of the W2NSD editorial pages on the back so you won't miss anything important when you cut out the response form, but in case that doesn't work out, feel free to send in a copy or scrawl your responses on a piece of paper of your own choosing.

If you reply via packet, put several number/letter pair responses on a single line to speed up the transmission from BBSs that send one line per packet, and separate the responses by commas: e.g., 1b,2c,3a, etc.

If, on the off chance that you've read this far and aren't on packet, and you think that packet is ruining amateur radio, by all means mail in a piece of paper with "No on Packet" written on it.

Definitions

For the purpose of this survey, "packet" is used as a shorthand word for any high-speed digital communications over amateur radio. This is just as wrong as saying "2400 bps" is the same as "2400 baud," but you know what I mean. So, in this survey, high-speed digital is defined as 300 baud and up, without using the Baudot or AMTOR techniques. Thus, the 9600-baud polling system used in eastern Canada in the early 80s counts as "packet." VHF is shorthand for "not HF" and includes 2 meters and above. BBS is short for any system where a computer is the primary "operator"—bulletin boards, mailboxes, file servers, hosts, private message systems, etc. TNC is short for whatever device it is that you use to do your high-speed digital communicating with.

Finally, thanks to WB6YMH and KA9Q for reviewing and suggesting some questions, and an acknowledgment to the annual KI2U Funl poll, where I lifted some of the demographics questions.

1) Sex:
A) Male
B) Female

2) Age:
A) 15 or below
B) 16–21
C) 22–39
D) 40–59
E) 60 and up

3) License class:
A) Novice
B) Technician
C) General
D) Advanced
E) Extra

4) Number of years licensed:
A) 1 or less
B) 1–5
C) 6–10
D) 11–20
E) 21 or more

5) Year you first used "packet":
A) Before 1980
B) 1980–1983
C) 1984
D) 1985
E) 1986

6) I first heard about packet from:
A) Friends/on the local repeater
B) Demo at a club meeting
C) Demo at a convention
D) Demo at Field Day
E) Magazine articles

7) My job is (or used to be):
A) Computer related
B) Rf related
C) Other

8) Aside from jawing on the local repeater, has the majority of your amateur radio activity lately been packet related?
A) Yes
B) No

9) Number of TNCs owned:
A) 1
B) 2
C) 3
D) Many

10) Do you use the AX.25 protocol?
A) Yes
B) No

11) Are you running (or do you also run) a protocol other than AX.25? (Also answer yes if you are pushing IP or other protocols through AX.25 UI frames.)
A) Yes
B) No

12) Do you have a radio devoted exclusively to packet?
A) Yes
B) No

13) Do you run a digipeater or other digital repeater where that station is up 24 hours a day and its primary purpose is to relay data for others? (Don't answer yes if you simply have DIGI ON set in your TNC.)
A) Yes
B) No

14) If you run a HOST/BBS systems, do you:
A) Run an WØRLI or RLI-clone BBS
B) Run a BBS that can forward to/from RLI systems
C) Run a different type of BBS
D) Do not run a BBS

15) Where do you use packet?
A) Mostly on VHF
B) Mostly HF
C) HF and VHF

16) Your packet operation is:
A) Mostly real-time person-to-person chats
B) Mostly BBS messaging/file transfer
C) Both

17) Do you have a forwarding BBS (RLI-style) in reasonable range of your station (one or two hops)?
A) Yes
B) No

18) Do you make frequent use of the forwarding feature of your local BBS?
A) Yes
B) No

19) Have you built or designed anything for packet, for your own use or others? This includes hardware (TNCs, modems, connect alarms, tuning indicators, etc.) and software (terminal drivers, BBS systems, etc.). Kits don't count.
A) Yes
B) No

20) Did you put your TNC together from a kit?
A) Yes
B) No

21) Would you be in favor of some type of "digital license," one that gave primarily digital privileges on non-HF frequencies, required a technical test with digital-specific questions, and did not require a Morse-code test?
A) Yes
B) No

22) Would you be in favor of something more than the question above, a "no-code" license that gave wider ranging privileges on non-HF frequencies?
A) Yes
B) No

23) Are you against ALL types of codeless license?
A) Yes
B) No

24) Did you get your ham license as a result of hearing about packet radio?
A) Yes
B) No

25) Do you know of anyone who got his license as a result of interest in packet radio?
A) Yes
B) No

26) The computer you currently use for packet is:
A) Commodore 64
B) Apple II
C) Z-80/8080-based system (Xerox 820, etc.)
D) IBM PC/XT/AT and clones
E) Macintosh
F) Dumb terminal
G) Other

27) On the computer you use for packet, do you have:
A) Floppy disk drive
B) Small hard disk (10 meg or less)
C) Large hard disk (greater than 10 meg)
D) No disk storage

28) What do you think about hams who send "digipeater on" beacons?
A) Tar and feather 'em
B) Put 6" steel spikes in their eyes
C) Put bamboo shoots under their finger nails
D) Beacons don't bother you

29) The "packet network" available in 1986 is:
A) More than you thought it would be when you first got on packet
B) Less than you thought
C) Pretty much what you'd expected

30) Is HF your only link to other packet users?
A) Yes
B) No

31) Is HF your only link to a BBS system?
A) Yes
B) No

32) Most of the data sent on packet today is message text or programs. There are also several oth-

er types of data, such as digital audio, digital video, graphics, telemetry, etc. Regarding non-text data:

A) You have used non-text digital communications
B) You would use it if equipment was readily available
C) You have little interest in non-text digital communications

33) Do most of your packets go through a digipeater?

A) Yes
B) No

34) How many digipeaters can you hit directly? (By digipeater, I mean a device or TNC on the air 24 hours a day with the primary purpose of being a digipeater. Remember to include all the frequencies in use in your area.)

A) 0–2
B) 3–6
C) 7–12
D) 13 or more

35) How many BBS systems can you hit directly?

A) 0
B) 1–2
C) 3–6
D) 7 or more

36) How many BBS systems can you hit using no more than one digipeater?

A) 0
B) 1–2
C) 3–6
D) 7 or more

37) Have you used packet in a public-service activity?

A) Yes
B) No

38) Do you think the current Part 97 regs on digital communications are:

A) Too restrictive
B) About right
C) Not restrictive enough

39) Is packet a part of your local emergency communications plan?

A) Yes
B) No
C) Don't know

40) In your area, are the packet frequencies:

A) Too crowded
B) Sparsely populated
C) Just fine

41) In your area, how many VHF frequencies are in active use for packet:

A) 1
B) 2
C) 3–6
D) More than 6

42) In your area, forwarding BBS systems are:

A) Using too much channel time
B) Not a problem

43) Regarding your packet use, do you:

A) Use it less than you once did
B) Use it more now than before
C) Stayed the same
D) Dropped it all together

44) Were you a Baudot (RTTY) or AMTOR user before you started on packet?

A) Yes
B) No

45) Enter the two character post office abbreviation for your province or state (in North America) or your callsign prefix (including number) if you are DX.

46) Enter A if you saw this poll in *73* Magazine.

A)

QRP

Number 22 on your Feedback card

Michael Bryce WB8VGE
2225 Mayflower NW
Massillon OH 44646

Last month we talked about mail-order parts suppliers. Let's look into some of the smaller suppliers. In particular, the suppliers that handle the makings of QRP radios. After that, we'll look at some of the more common parts that should be in everyone's junk box.

If you're looking for a one-of-a-kind part for your latest project, send an SASE to KA1BUQ at PO Box 249, Luther MI 49656. Here you'll find Doug DeMaw and son. While not sending out a catalog proper, their flyer always has the latest in QRP rf devices and other goodies.

Toroidal Cores

I seem to hear it all the time. Why do they use those rotten toroids in almost every QRP project? Well, I don't have the space to answer that one for now, but maybe later. I do know you should send for the latest information about toroidal cores to Amidon Associates, 12033 Otsego Street, North Hollywood CA 91607. Amidon sends out a slick "tech-data" flyer that I use all the time. It's worth having by itself. Amidon will sell in single lots and has very quick service. I'm sure you'll find them a welcome supplier.

Coils

I can solder up a storm all night long. Burn the midnight oil working the bugs out of a transmitter. But I just can't stand to wind those coils. Well, help is nearby. Caddell Coil Corp. just loves to wind coils. Many of the coils used by the most popular projects found in the ham magazines can be purchased from Caddell. Write to them for their latest catalog at 35 Main Street, Poultney VT 05764.

PC Boards

While winding coils is surely not for me, I really don't mind making the printed circuit boards. But there sure are a lot of people who hate that as much as I hate coil winding. For those of you who would rather shell out the bucks, drop a letter off to Circuit Board Specialists, PO Box 969, Pueblo CO 81002. While they don't print an expensive catalog, they will send you a flyer listing their newest boards. As their stock changes all the time, you'll keep your catalog file updated with CBS's latest flyer.

With more and more QRP projects requiring circuit boards, several other board manufacturers have appeared. Among the best of the lot is A & A Engineering, 7970 Orchid Drive, Buena Vista CA 90620. Send for their latest catalog. It also is updated as new projects come on line.

In the past two months I have mentioned a lot of parts suppliers. All of these I have done business with and have had very good results. As consumers, we should always keep one eye out for trouble. If you have done business with a supplier and had good results, drop me a line. We'll tell the world of their good business practices. Likewise, if you've had trouble with a supplier, let's get the word out.

Catalogs

I have been building QRP projects for quite some time now and have never run across a part that I could not find. Oh, yes, I had to do some letter writing to find just what I needed and perhaps paid more than I wanted to, but I always got the project done. If you don't have time to write for catalogs, how do you get a supply? That's really quite simple and very easy. In the back of this magazine you'll find the Reader Service card. Mark the advertisers' numbers, drop it in the mail, and then sit back and wait. In a short time

you'll be up to your nose in catalogs. Suppliers that choose not to use Reader Service numbers should be contacted directly. When you place an order with a supplier, mention that you saw the ad in *73*. That way the supplier has a way of tracking his advertisements.

Selecting a Supplier

Now that we've armed ourselves, let's determine which supplier to send our order to. I use several benchmarks in my purchasing. For an example, let us say that we need some IC chips for a CMOS keyer. I would first gather up all the catalogs from the suppliers that sell chips. Next, I would look up the price of 555 timer, 2N2222, 7400 TTL, 4001, and 4011 CMOS chips. Next, I would look up the prices of the chips that I need for the keyer. Compare the prices.

Stop now for a second. I may see that one supplier has a lower price than all the rest, but they have a $20 minimum order. They don't really specialize in IC chips, but rather in rf parts. That should make you think. Do they get their IC chips via a broom on the afternoon shift? Does their selection contain only a few of the very common types? Makes you wonder. If you're buying ICs, then stay with a supplier that makes a living selling them. There are, of course, several suppliers that sell a very large selection of both chips and rf components and do a very good job at both.

Now that I have picked the supplier for the parts, I look over the junk box. Since almost all mail-order firms have a minimum order and the total price of all my keyer parts comes to a little over eight bucks, I have to come up with the minimum order. The following is one part of Mike's Rule of Ten: I need only two 4011 chips for my project. They sell for 25c in single lots. That's a very popular chip. I use them all the time. The junk box has only one left in the drawer. In lots of ten, the price falls to 20c each. If I have the extra money, I'll order in units of ten, stock up the junk box, and have what I need for the keyer.

By keeping a close eye on the junk box, you can order what you need and save some money. I just hate to shell out two bucks for a 555 timer at Radio Shack (even if it is seven at night) to finish up a project. If I keep a good stock on hand and order in lots of ten, I don't have to. You never have enough 555 timers or 2N2222 transistors. (I really think that somewhere, someone will come out with a circuit for a color television using nothing but 555 timers and 2N2222 transistors. I plan to have enough of them in stock so I can start construction.)

The order is written out. Postage and handling charges are figured in. How you pay for the order, however, will help determine how long it takes for your order to get to you. Depending on the firm, personal checks take up to two weeks to clear the banking system. CODs cost extra and some firms will not ship COD. The best way to pay is with plastic money. Visa and Mastercard are honored by most mail-order firms (but be on the lookout for a service charge on credit card orders).

Many mail-order firms have toll-free phone numbers. Placing your order this way and using your credit card speed things up. Some companies have a higher minimum for phone orders.

In about a week the order arrives. Heat up the soldering iron and start to enjoy ham radio's best. There is nothing like the excitement of using gear that you put together yourself.

Junk Box

The best part of home-building your equipment is having the parts on hand. The QRP workshop should have resistors on hand from 100 Ohms through 2.2 megs. Transistors should include the 2N2222, 2N2906, MPF102, 40673, 2N3553, and 2N4416. The popular 1N914 diode should also be stocked.

Toroids should include FT-37-43, T36-6, T68-6, T50-2, T50-6, FT37-61, FT37-63, FT50-43, FT-37-2, T68-2, and T37-4. Add some ferrite beads to the pile also.

The following rf chokes will fit 90% of your needs: 1 mH, 10 uH, 200 uH, and 10 mH.

Capacitors, both electrolytic and ceramic, should include .1 uF, .01 uF, .001 uF, .2 uF, .005 uF, 100 pF, 560 pF, 470 pF, 330 pF, 47 pF, 56 pF, 750 pF, and 820 pF. Of course, the smaller values are either silver micas or polystyrenes.

This is just a small list, but expanding your junk box will allow for more flexibility with your next QRP project. ■

GIVE YOUR EARS A BREAK!

(And the XYL's too!)

The *AUTO-KALL*, AK-10, is a DTMF selective calling unit. It connects to the external speaker jack on your VHF/UHF FM transceiver, scanner, etc. Your speaker remains silent until someone sends your personal 3-digit Touch-Tone* code. That means you (and the XYL!) don't have to listen to all the chatter all the time. But if someone wants to reach you they can. Great for families with two or more hams, activation of emergency nets, etc.

FEATURES

- Completely assembled and ready to use.
- Easy setting of your personal code in seconds with small rotary switches. No jumpers to solder.
- Speaker resets automatically to silent-standby and leaves red LED on to let you know someone called if you were away from the rig.
- 8-15 VDC. CMOS circuitry provides for low current operation.
- Built-in speaker. External speaker jack also provided.
- Measures only 1¼ x 3 x 5½ inches.
- Decodes all 16 digits.

*Touch-Tone is trademark of AT&T

FLEAING WITH MY LIFE

With summer just a faded memory, it's time to reflect on the concluded ham flea market season. Ham flea markets are good old-fashioned All-American fun. Heck, Field Day and flea markets are the only times many hams get out into the clean, healthy sunshine. Heroin addicts and prisoners have healthier complexions than most hams.

Going to a flea market is an exercise in escapism. You meet celebrities (I spotted famed subway gunman Bernie Goetz at a Long Island flea market this year), you eat hot dogs, fondle microphones, and ogle amplifiers. FUN, indeed. But there's a flip side to the coin as well—selling merchandise at a flea market.

If you've never sold stuff at a flea market, you should give it a try, since it's an experience no ham should miss. I'd rank it up there with going on a DXpedition to a tropical island, visiting ARRL headquarters, or eating the food at a ham banquet. All of these experiences hold their transitory displeasures, but you're not a *real ham* unless you endure them.

I got my taste of selling ham junk at a LIMARC ham fair a few years back. Ham junk, incidentally, is an interesting phenomenon, endlessly recyclable and apparently immortal. Have you ever seen a boat-anchor Hammarlund at Dayton that you swear you saw two years earlier at a flea market in Arizona? Radio amateur deja vu. That Hammarlund has probably been on the flea market circuit since 1957, passing from owner to owner at a rate of two or three hams per year.

My inspiration to sell ham junk came when I opened my garage door and saw a Hallicrafters SX-111 bounce off the roof of my '72 Corvette. Oops! Well, roof panels can be replaced fairly easily, if not inexpensively. (I got the new ones at a car-collector flea market, but that's another story.) So, fearing more potential body damage, I loaded my excess effluvia into my Ford and pointed it toward the Islip Speedway, the home of the LIMARC flea market in those days.

Pulling into the Speedway's parking lot, I paid my seller's admission fee and found a nice parking spot/sales location near the portable toilets, a locale guaranteed to attract a crowd. The fragrance, if you can stand it, also keeps browsers from cluttering up the area around your table. Since my job requires me to deal with PR flack on a regular basis, I have no trouble with odor.

There is an art to setting up a flea market sales table. I used a couple of folding picnic tables, which work nicely as long as you don't put too much weight on them (they bend). The idea is to place the cheap small stuff up front and the expensive big stuff in back. Few people make an impulse purchase of a $700 computer, but many are likely to impulsively pick up a 50-cent book (Barry Goldwater's autobiography was a big seller for me).

Price tags are also a must. Hams, as we know, tend to be wimps. Many are too bashful to ask for a price, or figure that their job as a driver for the Gotham Bus Company won't qualify them to purchase your high-quality merchandise. Anyway, if you happen to find a ham who is outgoing, the price tag will work as a good bargaining point.

Hams negotiate funny. Some are very picky over what are really quite mundane articles. For instance, I remember one fellow who made a big deal out of a BNC connector.

"This a BNC connector?"

"Yep."

"How much?"

"Fifty cents."

"What's it made out of?"

"I dunno. Metal, I guess." I'm getting bugged.

"It looks dirty."

"Wash it."

"I'll give ya thirty cents."

"No way," I say.

"Forty cents."

At that point, I picked up the connector and threw it at the guy's head. It missed.

He said, "No deal, I guess."

I said, "You're right, I guess."

The BNC broke the windshield on a nearby sedan.

Then you have the hams who will buy anything. For instance, there was one guy who bought a $220 Heathkit oscilloscope from me. It was only about a year old, and I was selling it for pretty close to list price. He didn't negotiate at all. "Like the scope, hate building," he said.

The strange part was that the OM didn't plug it in, didn't check my construction—nothing. Now, I'm a pretty good craftsman. I keep my leads short, tighten my screws, and apply white hot solder. But he didn't know that. He *trusted* me. I don't even trust myself. He paid me cash. He didn't know who I was. If it had been a bum scope, he would have been out of luck. Weird.

But the best part of selling at a flea market is meeting all of your friends.

"Hey! It's KI2U! Mr. Fun!" Oh, God, no. It was Jack, a flake who habituated a local repeater. Some dogs have fleas; this repeater had Jack.

"Lookee here! A box of floppy disks! They make great Frisbees!" A shrill laugh filled the air. Several nearby hams ducked for cover, thinking an ambulance was plowing through the crowd.

I grabbed the disks out of Jack's hands.

"Why don't you visit the ARRL booth?" I suggested.

"They chased me away three times," said Jack. "I decided to give equal time to Wayne's exhibit. Hey, is this cheap folding table the best Wayne could afford?"

"This isn't Wayne's table," I replied. "It's mine."

"Hard up for cash?" he said.

Before I could answer, a butterfly skittered by and Jack ran after it. He never came back.

A small miracle. But I wasn't out of the woods yet. Joe the DXer was headed my way.

"Fresh out of countries, Joe?" I said with a smile.

"Hmmmm," grumbled Joe. Like most honor roll DXers, Joe took ham radio seriously. It wasn't a hobby to him. It wasn't even a business. It was a sort of hair shirt.

"Got a 6146B?"

"Yes I do, Joe. It's right here. Let me see . . ." As I was reaching toward my tube box, a crackle shot through the air and a panicked, garbled voice screamed out of Joe's HT.

The blood drained from Joe's face.

"What is it, Joe? An emergency?"

"You bet," he said. "Flackaran's on 20."

Like Jack, Joe never came back either. In fact, I never heard from Joe again. I suspect he moved a bit closer to Flackaran.

On the whole, the day turned out to be profitable. I made $325, got a nice suntan, and learned something about my fellow hams. Would I do it again? Not on your life.■

RTTY LOOP

Number 24 on your Feedback card

Marc I. Leavey, M.D. WA3AJR
6 Jenny Lane
Pikesville MD 21208

Sometimes I wonder just how many of you pay attention to the little "tease" I try to leave at the end of each month's column. To save you the trouble of looking back, I alluded to the perennial contest I face answering all of your mail. Well, here I go.

Ed Kotz NG0R of Roggen, Colorado, writes with some modifications to the HAL ST-5A demodulator for computerized interfacing. You all may recall that back in July I recounted Ed's tale of woe in trying to make his secondhand ST-5 operational. He related that my "seed" in saying that the FSK output used ±15 V dc got him going. He devised the modifications shown in Fig. 1, which have his demodulator copying S1 signals, and even some buried in the noise, with good results. I thank Ed for his contribution, and I am sure that you all do, too.

Another letter this month comes from Gregory McIntire, who introduces himself as an SWL from Belle Fourche, South Dakota, and who has been enjoying copying RTTY on his Commodore 64 computer. Why not try to get a license, Greg? Transmitting is more than half the fun! Anyway, Greg has been looking at one of the more common RTTY exchanges, that of sending various forms of artwork by sending strings of MMMXXX III:::.:IIXXMM or such to create a likeness of anything from a girl to the man in the moon.

As Greg says, "I decided that this mode (RTTY) and its capabilities could be utilized for something more constructive. Why not use RTTY to send high-resolution pictures? How about hi-res schematic diagrams for the many electronics enthusiasts of the amateur community? Since I had never seen any software for the purpose of doing this, I decided that I must write the software myself. I did, and this is how it works with RTTY. First you 'draw' a schematic diagram on the C-64 monitor screen using the keyboard. Next you SAVE the drawing as a disk file. (You may also print the drawing on paper.) Now you can change the saved disk file to a list of numbers. This is saved as yet another disk file, either a sequential (SEQ) or program (PRG) file type, depending on which type your RTTY software requires. You may now 'fire up' your rig and transmit the list of numbers via Baudot, ASCII, or AMTOR. [I assume you could even send them via Morse.—mil] The person on the receiving end will also need a C-64 or C-128 and a copy of my software to reproduce the hi-res drawing."

I have printed Greg's icon menu and diagram in Fig. 2 and the list of numbers generated to reproduce the diagram in Fig. 3.

The concept is a good one, Greg, although not totally unique. The TRS-80 Color Computer crowd has a program called PIX-CMP, which does essentially the same thing with high-resolution CoCo pictures. In fact, the CoCo Program Listing included here will reconstruct the diagram shown in Fig. 1.

Now, here comes the hook. Why not work up a system that is computer independent? If you could come up with a scheme to generate a number list that could reproduce a similar picture on Commodores, CoCos, PCs, and even Ataris, *then* you would have something. I might even hazard a guess that *73* might be interested in printing the programming. Of course, if they won't, I will. Let me hear from you with your developments.

Staying with the Commodore fleet (sorry), here's a letter from Bob May, II K4SE of Jonesboro, Tennessee. Bob writes that for the past three or so years he has been using a VIC-20, Kantronics' Hamsoft program, and the MFJ-1224 interface for RTTY. He has been quite satisfied with the results. Recently, he bought a Comrex CR-220 printer, which works well on his Commodore software, particularly the word processor. However, when he pushes the control-P, while "P" appears on the screen, he gets nothing on the printer in either transmit or receive. He has tried another VIC-20 with similar results and wonders if I have any idea of what's happening.

Well, Bob, while no one I asked was familiar with the exact combination, a common problem did suggest itself. The programming for special keyed functions is of-

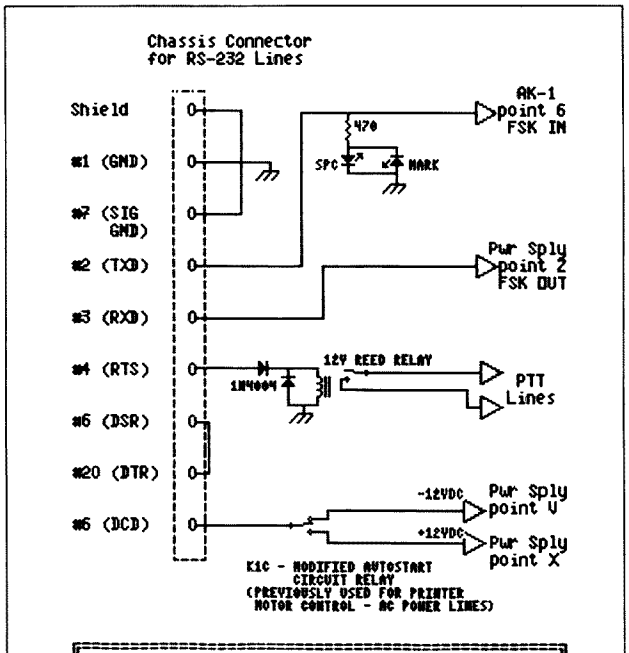

Fig. 1. Modifications to the HAL ST-5A RTTY demodulator for computer interfacing.

Program Listing. A CoCo program to reproduce Fig. 1 (PIXCMP format).

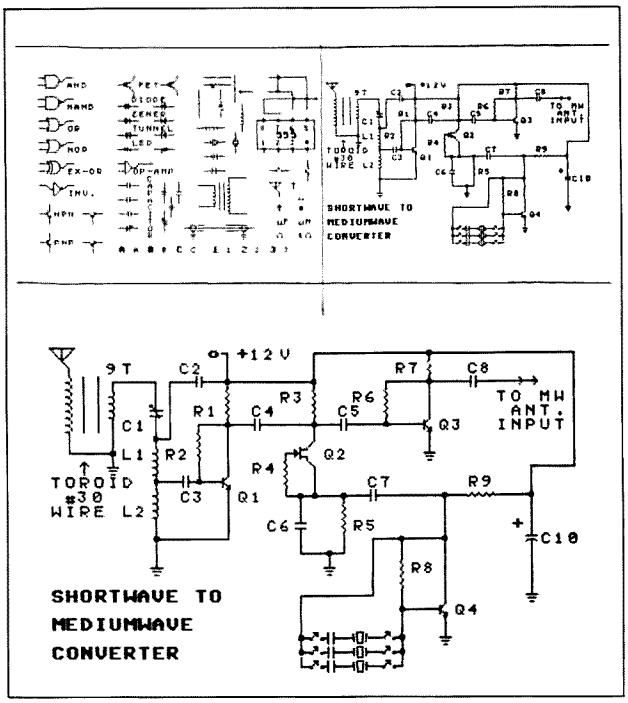

Fig. 2. The top left "screen" is a Menu screen that shows the various symbols that can be printed. The picture at the top right is an example schematic diagram. The lower picture is an enlargement of the top right picture.

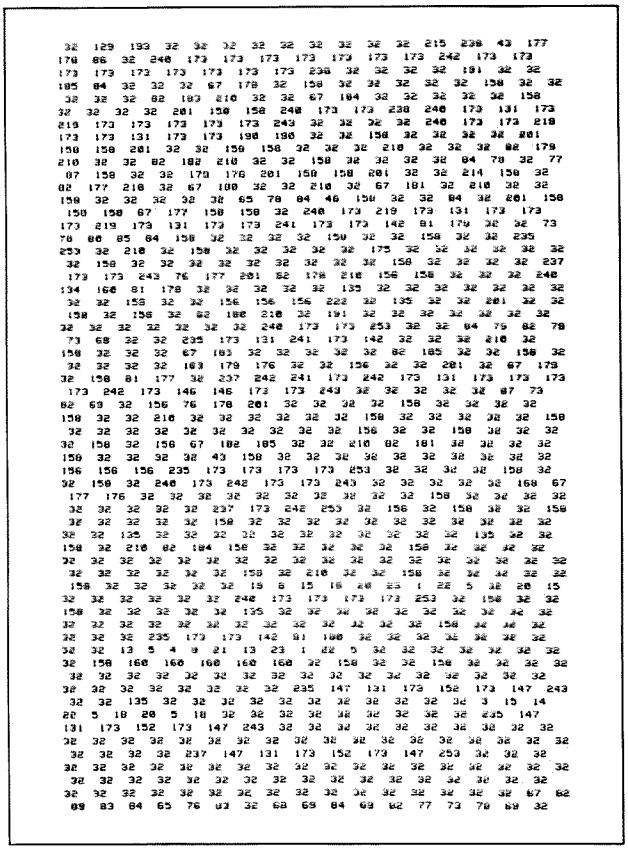

Fig. 3. List of numbers (saved as a disk file) that are transmitted via RTTY and used to reproduce the schematic drawing in Fig. 2.

ten software dependent. That is, it is the word processing software that interprets the control-P to output hard copy. The Hamsoft program probably does not have this function built in, or if it does, it is reachable by another command. I'll monitor the mail here for input from other users not reached to date and publish what I find out right here. Thanks for the interest.

Maydays from Commodores seem to be in vogue this month. Roy Hoelke KA7TTZ in Heron, Montana, tells me that he just got a Commodore C-128 computer and would like to put it onto RTTY. He wonders which of the myriad of programs to buy. Well, Roy, if sheer popularity counts, Kantronics' Hamsoft seems to be the runaway favorite. I have heard nothing specific regarding the C-128, but, if nature runs true to history, I will—just after this column sees light. If so, I shall pass along the info.

Sometimes the fruits of technology make what was once the complicated solution the simpler one. Take, for example, the problem posed by Richard Steck W9RS of Lake Forest, Illinois. Richard asks if I know of a simple, low-cost way to convert AFSK (170-Hz shift, 45.45 baud) Baudot transmission to ASCII at 110 baud. There is a station in Chicago, he relates, that transmits weather information on 147.06 MHz, and he would like to get hard copy without getting a "Baudot klunker." He adds, "I would prefer not to tie up a computer for this."

Why not? At one time, I would have recommended a hardware solution, beginning with a clock running at 45.45 baud, driving a UART to receive the output of an outboard demodulator. The output of the UART goes to a decoding matrix, on either a custom-built diode matrix or an EPROM. And the output of the code-translation chip goes to yet another UART, this one clocked at 110 baud, to output the ASCII desired. All that is left is interfacing the TTL-level ASCII to RS-232 or 20-mA loop voltages. All that is left?

But no more. While I may have a personal bias, most of you, regardless of which inexpensive computer you are attracted to, particularly the CoCo or the Commodore, should be able to put together a receive-only system—using either a software-demodulation scheme or a simple one-chip PLL demodulator as I have described here in the past—for less than $100. If you are a bit of a hacker, an old 4K CoCo can often be had for a song from computerists who have "stepped up," and it will do quite nicely. Ask around, I think that you will find it is both easier and cheaper to "tie up a computer for this" than to go through the tsoris of building a dedicated Baudot-to-ASCII converter.

Lance Miller, PhD N4LXE of Lakeland, Florida, tells me that he is "hooked" on RTTY. He tells me that he's been reading RTTY Loop for the last year or so, and the issue describing the simplicity and low expense involved in beginning RTTY really did it. He dusted off his old DX-100 and read some more columns. In another RTTY Loop he discovered how to QSY the vfo, and at the Orlando Hamfest he fell into an ASR-33, in really beautiful condition—but with no manuals, of course.

He goes on, "After almost blowing out both inguinal rings lugging the thing across the parking lot to the car, I began to have a second thought or two. The thoughts multiplied during the drive home. 'Miller, you've been out of the hobby for a long time—technology has passed you by, and you don't know a dang thing about Teletypes®!' Nevertheless, I got it into the shack, with all intercalary discs intact, and began inspecting my prize, only to discover that I *don't* know a dang thing about Teletypes. Then I recalled that old WA3AJR [old?—mil] sez in his column every month, 'Drop me a line—be sure to include an SASE.'"

Well, Lance, I am sending you some of the material that's been printed here in past issues of RTTY Loop, and I hope it helps. One of the first things I hope you learn is that most, if not all, Teletype machines break down into several pieces. I, for one, normally break one down before attempting to carry it–you may have to make more trips, but it does wonders for the back! Enjoy and good luck.

Another Teletype acquisitionee (neologiophiles, take note) is Jim Cregger KA0OZB in Jefferson City, Missouri. Jim would like to hook up a Model 33 Teletype to his TI-99/4A computer. Well, Jim, as I have covered here in the past, this should be possible with a circuit to convert the output of the computer, which is, I believe, RS-232, to the input requirements of the printer, a 20-mA loop. I am

sending you some material from old columns which may be of help. Please let us all know how you make out with this one.

Regards to Jim Walroth N3AWS, who sent along his comments regarding the TRS-80 Model 100 material published here some months ago. Jim sent his comments on CompuServe and added his wish that I publish an update of the RTTY BBS list we had here some time back. I would love to, Jim, but no one, *no one*, has sent me any updates to that information. I would not doubt that packet has taken over many earlier Baudot or ASCII BBSs, but surely there must be some new activity. I guess they are not looking for any new users. Hint, hint...

I should not have to remind my regular readers, but those of you who may be new to the magazine, having taken Wayne up on his excellent subscription offer, may be interested in some of my more mundane announcements. There is a list of reprints from old columns available. The list can be yours for a self-addressed, stamped envelope, sent to me at the address at the head of this column. I am available via E-mail on either CompuServe (ppn 75036,2501) or Delphi (username MARCWA3AJR), and I do try to check into either of these every few days. Feel free to leave questions or comments to me there. If you've read the fine print in this issue you know that it is your duty, if not your obligation, to fill out the Reader Service card and to let those advertisers whose products interest you hear from you, and especially hear that you "Read About It In *73*." Not only that, but your votes and comments on the articles and columns in this issue are important, including your coments on RTTY Loop, to help give the editorial staff the feedback they need to keep *73* the vital magazine that it is.

No one has commented on the "Green Keys" question yet! Next month, I just may have to type a little about it. Who knows? The Shadow? I'll never tell. I guess you'll just have to wait for next month's RTTY Loop!■

ABOVE AND BEYOND

HERE WE GO AGAIN

You'd think I'd learned my lesson from Slide Mountain in June of 1985 (see "Just Leave Me Here To Die!" in the November, 1985, issue), but nooooo! I just HAD to climb up another peak for the September VHF QSO Party. And I just HAD to backpack everything in again, including the motorcycle battery. Some people never learn, right?

Well, I actually DID learn something from last year's DXpedition. A few things, to be exact! For starters, I was able to calculate more accurately how much weight I could carry safely, and with that figure in hand could optimize the equipment-to-weight ratio. Another lesson learned from Slide Mountain was to make my ascent in the early morning hours on Sunday, thus avoiding an overnight stay and the attendant camping equipment.

Believe me, once you've tried it, you're hooked but good. This year's expedition originally focused on Overlook Mountain, a 3,150-foot rise on the eastern edge of the Catskill Mountains near Kingston, New York. Overlook Mountain is in grid FN22 and has an excellent shot for about 200 degrees from the north to the southwest—right toward all of the activity on the East Coast.

Trouble was, I had been beaten to the punch by John Lindholm W1XX and his multi-op crew! It seems that John had been "cultivating" this site for some months now, and had finally wrangled permission to run a generator-powered multi-op station with amplifiers and big beams from the New York State Department of Environmental Conservation. John was very helpful in suggesting some alternate locations, however, and I soon decided on a promising site in FN23 called Cathead Mountain.

This would put me considerably further north, but FN23 is a relatively quiet grid and is rare on 432 and 1296 MHz, two bands I had planned on bringing along. It rises 2,425 feet in the southern Adirondacks and is accessible by a 1.25-mile trail (actually a power line right-of-way) which can get pretty steep in places! The paths to the south, east, and west looked very good, so Cathead Mountain it was going to be.

Readers will remember my trouble with my MMT-432/144 transverter last year just prior to the contest. Well, Murphy hit again and it died for good! Frantic calls by myself to ham dealers around the country (those 800 numbers are great, aren't they?) failed to turn up an Echo 70 or Yaesu FT-790. Even used ICOM 490s were unavailable! Ivars Lauzums KC2PX, who runs the PX Shack, placed a call to the Microwave Modules factory in England, wherein another i-f and final board set was located. It would come in on the next British Airways freight flight—hopefully before the contest weekend!

I set about the remainder of the station. The 144-MHz setup was my trusty TR-9000 with its impossible-to-read red LED display and 10 Watts output. The receiver is a bit suspect, so I supplemented it with one of the Microwave Modules rf-switched GaAsFET preamps courtesy of Ivars. 1296 would be run from an SSB Electronics LT-23S driven by the TR-9000. I also located a secondhand IC-502 for 50 MHz, but didn't expect a lot of performance with the 3-Watt output and quarter-wave whip. I wasn't disappointed.

220 MHz rounded out the picture with an ICOM IC-3AT barefoot. I figured on making a few contacts on FM and that was indeed the case, as most big contest stations (and not a few smaller ones) are using 223.50 MHz for their 220 contacts.

Antennas were simple: A 4-element KLM 144-MHz beam using a dipole-driven element and a 23-element F9FT Tonna yagi for 1296 MHz. I selected three pieces of 20-gauge generic antenna mast from Lashen Electronics, our local radio emporium. Mike Crawford WA2VUN helped by fabricating a lightweight antenna foot support made from a 7″-diameter piece of aluminum with a 3″ piece of 1-1/4″ pipe welded upright. Four holes were punched around the perimeter for stakes to anchor the antenna support, and the 20-gauge masting slipped over this upright piece. A slip ring and guy ropes provided support for the mast at the 10-foot level.

My brother Miles, who lives in Kingston, New York, and who is an avid outdoorsman, agreed to come along for moral support (he isn't a ham), as well as to investigate the mountain while I was operating. I located the appropriate USGS maps to aid in plotting distances worked and beam headings. We were set to leave from his house and drive north to Great Sacandaga Lake, where we would camp overnight about six miles from the trailhead. This would allow an early start.

Friday came and I was still awaiting news of the shipment from England. Too late! The British Airways flight wouldn't

Photo A. The method used to transport the antennas up the mountain. The ripstop nylon bag worked well, as the sharp 1296 elements couldn't poke through. Total pack weight was about 45 pounds.

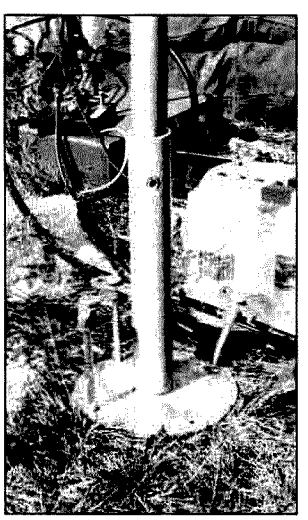

Photo B. The method used to secure the footing of the portable mast arrangement. This saved about 9 pounds from last year's tripod.

Photo C. Hard at work in a pileup (well, for a couple minutes, anyway). The 50-MHz rig is set on the calling frequency of 50.110 to listen for any DX call.

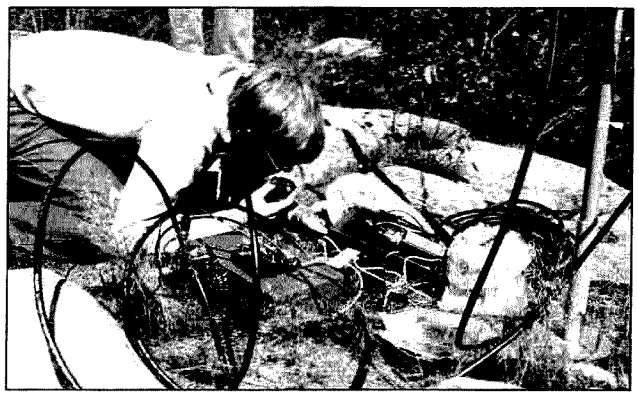

Photo D. This is how to read a red LED display in bright sunlight.

land until 4 p.m. The customs broker estimated it would take about two hours to unload the plane and have everything ready for U.S. Customs agents, which unfortunately would have left an hour earlier at 5 p.m. 432 was out! The silver lining was that my load would be that much lighter.

Saturday afternoon rolled around and I packed the car, departing at 3, an hour into the contest. Much fun was had giving grid squares out on 223.50 MHz FM from the car with my IC-37A. Mike WA2VUN (whose tower you undoubtedly read about last September) was on with a mammoth signal and I was able to track him on 220 FM simplex up the New York Thruway about 30 miles! I also got a big kick out of working W2SZ/1, who must have the strongest 220 signal I've ever heard. I gave them FN21, 32, and 22 during my trip north.

After arriving at the campsite, we plotted our strategy for the next day: Early to rise, a quick breakfast, and off to the trailhead. Of course, we hadn't figured on getting to sleep at 11:30 p.m.! The temperature dropped to below 40 degrees and it was extremely chilly when we arose the next morning at 5:30. A quick meal at the local greasy spoon in Northville and we soon found our way to the trailhead, located at the end of a dirt road.

The photos tell the story best: After taking a half-hour to load up, we set out on the trail which quickly changed from a two-lane grass road to a cleared-out right-of-way for the power lines to the ranger station and fire tower up top. This is a fairly rugged trail, crossing rocks and streams in several places. Due to the "cut swath" of the right-of-way, substantial erosion had occurred and the footing was tricky. After about an hour and 15 minutes, we had reached the top and were greeted by brilliant sunshine as well as 15–20 mph winds.

The antenna masts went together quickly, and the footing plate was installed posthaste, as were the various yagis. Several feedlines were connected, the antennas raised, and we were on the air at 10 a.m.—about an hour later than I had planned. (These things never work on schedule anyway!) Activity was thick on 144.200 and I planted myself about 144.180, looking for the folks back home who had been on for an hour already and probably thought I gave up and went home!

As you might expect, the first stations worked were the big mountaintop multi-operators, such as W2SZ/1 and W1TKZ in FN32 and FN33, respectively. After working a few locals, I heard Mike WA2VUN calling through the QRM and was able to give him his first contact with FN23 on 144 MHz. While working Mike, I was called by VE2DFO in FN25 off the back of the beam for a new multiplier, then WA2SLY in FN30 and KC2PX in FN20. This was a great location! The weather was excellent, and I can't emphasize that enough: Not a cloud for hundreds of square miles that I could see from the mountaintop (and believe me, I could see for hundreds of square miles!).

I also managed to thwart the bad luck on 1296 that had dogged me the past few years: You know—just go to a mountaintop, set up on 23 cm, and it instantly rains. Not this time, although Murphy did nail me on 432 MHz. Stations were pleading with me to go to 70 cm for FN23, and I would have loved to oblige them. Oh, well—next year, guys. W2SZ/1 actually heard my third harmonic on 432 from two meters and tried to work it! That's how good the path was between us... line of sight.

1296 operation brought six contacts in four grid squares. I sure was popular, and thought of how nice it would have been to have 10-GHz and 902-MHz equipment. 223.50 brought some more interesting QSOs, including W1VD and WA1STO in Connecticut about 100 miles distant using just the IC-3AT. I also worked my own grid on every band via WA2RQC (thanks, Otto and Doug). 50 MHz was a big flop, mostly due to the lack of a good antenna. But I did bag Steve WB2WIK on what had to be one of his more difficult contacts from FN20. Next year, 10 Watts and a three-element beam. Live and learn!

My last contacts were with John W1XX, who convinced me to come up the mountain in the first place. I worked them quickly on 6, 2, and 1296 and they were LOUD from Overlook Mountain, especially on 23 cm with a S9 +30 signal. What a location that must have been, and I can't wait to see the score they rang up.

I was visited by my stepbrother Peter Peff and his two sons from Bennington during the afternoon, as they came over to check out the climb and watch the festivities as I worked in succession northern Ontario, eastern Pennsylvania, and Cape Cod (FN41) on 2 meters. All too soon it was 2 and Miles was getting antsy, so we struck the set (after a few futile skeds on 1296 with FN43 and 42) with most of the battery power still there.

The grand totals for my effort: 60 QSOs and 28 grid squares in about four hours time. Not bad at all! If I had a decent beam on six meters and a 432 station, that total probably would have been over 100 QSOs and 40 grids for the same time interval. Next year: 10-Watt stations on all bands, plus yagis for each band and a second operator. (Maybe even 902 and 10 GHz!) Possibly even an overnight stay if I can arrange it, but I'll still backpack the stuff up to the site as always. What the heck, I could use the exercise.

Now, I just have to come up with something for the January VHF Sweepstakes.... Hmmm, how about cross-country ski portable on 6 and 2 meters from a mountaintop? Now, that would be different!■

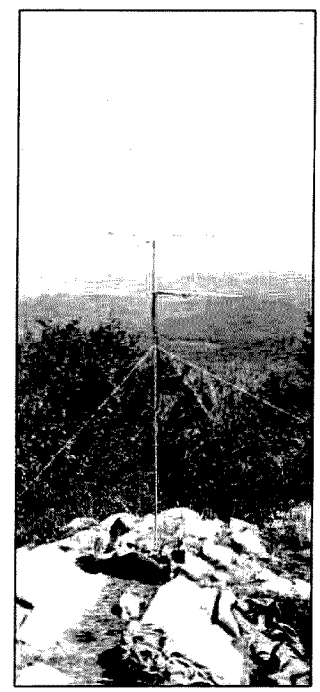

Photo E. A view from the fire tower looking east. The eastern reaches of the Adirondacks can be seen in the background. The White, Green, Catskill, and Berkshire Mountains were visible from the site.

NEVER SAY DIE

from page 14

but which the League did not. Since these are French territories, it's not out of bounds to presume they just might happen to know a bit more about the situation than the League. By the time we added up the countries accepted by all of the IARU societies we had 396. Yep, almost 400 bona fide countries.

396 beats the hell out of 325 or whatever the League is buying these days, so starting in January, 1987, we'll have a new DX country award available from *73*. The award starts with 100 countries, with stickers for 200, 250, 300, 350, 360, 370, 380, 390. . . and yes, 396. It's not beyond possibility that there'll be a few more added, bringing us over the 400 mark. . . I hope so. When it comes to working countries, the more the merrier, so why be stingy?

Yes, we want to see the QSL cards confirming the contacts. Hey, remember that I'm not new to this DX award business—I started the WPX award and a bunch more, so don't screw around with any fake cards. One fake card and your name is mud. I work enough DX so I know what's out there and have many of the cards myself, so I can spot ringers. Please try to remember this whole thing is for fun. . . and what's the fun if you cheat?

In addition to the all-mode award, I'll have special awards for working 100 countries on several modes—two-way RTTY, SSTV, packet, AMTOR, high-speed automated CW, and mobile one way. . . again with stickers for additional countries. That ought to keep you busy.

All contacts must be made after 0000 UTC, January 1, 1987. I'm planning on running a picture of the first winner of the award on the cover of *73*, so let's see how long it takes. It doesn't take very long for a DXer with the time to whup off a hundred countries—I've done it in a single weekend on SSB. Yes, of course it was during a DX contest, but it still was a big challenge and I made my one-hundredth just minutes before the contest ended. Did it all on 20m sideband.

One time when the band conditions were good I set up a new ham station and got to work on DX. It took me a week to get 100 countries, a month for 200, and a year for 300. That's about par unless you haven't much else to do. . . a situation I haven't enjoyed since I got into publishing 35 years ago. There's nothing like a monthly publishing deadline to keep you busy the rest of your life.

We'll be publishing the scores in *73* so you'll know what you're up against. Is there any reason I can't ask you to send in computer printouts of your award progress along with your cards?

I suppose I shouldn't mention that I'll have stickers for single-band awards, making it possible for you to get up to 396 countries on as many different bands as you want. The minimum award is for one hundred countries per band. That's duck soup on some bands, but a definite hurdle on 160, for instance.

Will the special mode awards encourage DXpeditions to take along RTTY and other special mode gear? I hope so. It'll also keep 'em busy a few more days as they work 10,000 stations on eight bands with six modes per band. Let's see, that's 480,000 contacts. That could take well over a week. If the DXer works two contacts per minute 24 hours a day, it would take 167 days to get done—that's figuring good propagation all the time. But 10,000 won't even begin to peel off the first layer of Japanese DXers, much less get to the U.S. and Europe. Oh well, look on the bright side, if everyone puts a Green QSL in their envelope you'll be able to retire with a half million dollars. Is there a serious shortage of hams who will work 167 days for a half mil? I can just see the DXpeditions sprouting.

To make your DX hunting a little more fun, I've had the *73* art department put together a world DX map which shows the 396 countries. I always thought the old *Radio* magazine DX map was the best I'd ever seen. It was black and white so I could mark the countries with a colored pencil when I worked 'em. I put 'em in pink when I contact 'em and solid red when the QSL arrives. Those confounded maps in color don't let you show what you've contacted as easily. Map pins aren't as much fun as coloring. Here's where your college course in Map Coloring 202 will stand you in good stead.

How many CBers does it take to hunt elephants? 51. One to carry the guns and 50 for the decoy. That was originally a Polish joke, but I'd rather offend CBers.

Okay?

QSL DESIGN CONTEST

Getting any new project going is usually difficult at best, so I have been hoping we'd not screw up the early customers for our QSLs too badly. Several years ago I converted the garage in our old Pine Street building into a print shop. I put in a couple fair sized presses so I could put out amateur radio books without being a prisoner of a local printer.

"I've done the designs we've used so far, so it's about time for you to take some responsibility. You design our next card."

It takes quite a bit of equipment to do this—plate makers, a couple offset presses, a power paper cutter, a folding machine, an inserter, and a stitcher to put in the staples. I bought everything second- to tenth-hand, so my investment was fairly modest for the print shop I put together.

When I sold everything three years ago all the print shop equipment went with it. Fine, that gave me an opportunity to start over and put together a new print shop using brand new equipment, sparing no expense. My WGE print shop (Peterborough Press) has a large four-color sheet-fed offset press for printing full-color brochures and booklets, a four-color web offset for direct-mail letters, an envelope press, plus the usual bindery equipment—a half-million-dollar investment, all told.

I started printing QSL cards many years ago as a way to keep my book presses busy in between major jobs. I explained in my ads that the prices were low because the QSLs did not have priority on press time. It was a way to provide first-class, yet inexpensive cards, priced so we wouldn't lose too much on the deal. They were a great success.

I had one design with a blue photo of the world taken from space. We were able to print large sheets of these ahead during slack press times. The back of the card had a simple report form—with everything essential for DX-CC credit. It, too, was printed ahead when we had the time to spare. That left only the name and address to be put on the front in black, ganged up 16 at a time. Even when we were busy printing books we were usually able to work in some QSL fronts so orders wouldn't have to wait too long.

The key to keeping QSL prices low is being able to make them in large quantities and to automate as much of the process as possible. By printing two out of the three impressions ahead when the press time was the least expensive we were able to cut costs. By printing them in large sheets instead of one at a time, the way most QSL printers do, again we cut costs.

We set the type on our typesetting system so all we had to do was shoot it into negative form and paste it into the flat, ready to make the printing plate. We'd print the cards 250 at a time, so if someone wanted 500 cards we'd print two cards—1,000 cards meant four at a time. Then, when the printing was dry, we'd cut the cards, box 'em and ship 'em by UPS.

We're using the same system again, with the name, call, and address set by our new computer typesetting system. This one even puts the type in the right position on the card, saving a paste-up step—and a few minutes work.

We started out with some of the same designs I used several years ago—nice cards. We've been getting lots of great letters from readers who've ordered the cards and like 'em. Despite a heavy work load in our print shop we've been getting the cards out in a surprisingly short time. I've explained to my people that when readers order something by mail they somehow expect it to arrive the next day—so if we want repeat business we'd better give the best service we can.

Which brings me to my point—I eventually get around to my point, it's just that I digress a lot. By the way, "a lot" is two words. I don't know how many readers write to me spelling it "alot"—there is no such word. Allot, yes, but that's a different word. Hmmm, another digression! Oh, yes, my point. . . well, it seems to me it's getting way past time for us to have a new

QSL card design. I've done the designs we've used so far, so it's about time for you to take some responsibility. You design our next card.

Sigh, I suppose just plain glory and fame aren't enough for you. Crass capitalist that you are, I can see you sitting there thinking big bucks. Look, I already said I'm trying to provide the lowest cost QSL cards I can, so get visions of sugar plums out of your mind. No, what I thought might be nice would be a lousy $100 prize for the card design I like best—and maybe $50 for the second best. Let's see what you can do.

Remember, QSL cards have to be a fixed size as required by the post office, so don't get into any poster-sized extravaganzas. The front can be any two colors you like—the back one color. We'll have to print the call and name/address on the front of the card for economical reasons.

Entries should be in my hands by January 31, 1987 (*73* Magazine, QSL Design Contest, WGE Center, Peterborough NH 03458). The quality of the idea is more important than the artwork itself. I've got some superb artists here who can do almost anything. Neatness does count though. Try to remember to put your own name/address on your entry.

Another card I came up with a few years ago had the call in as large letters as possible—the idea being that when hams put your card on their wall it will stand out from all the others. It's a real kick when you see a picture of a DX station and there is your card! The normal small call letters get lost on a shack wall.

When I first got into amateur radio every ham not only had QSL cards, they sent QSLs to confirm every new contact—even on 160m. I think someone would have a heart attack these days if they got a QSL for a two-meter repeater contact. That's sad, really, because it's nice to have a chap's card in your hand when you're talking with him—even if it's over a repeater. Cards are a nice way to keep track of friends.

I remember the time twenty years ago when I visited VK6RU in Perth and he pulled my QSL card out of his file—from a contact twenty years before that! Twenty years! I've got to get down and visit Australia again. . .that's much too long to stay away. You know, I found an old file of mine—a detailed log of my African safari and around-the-world trip twenty years ago and all the interesting hams and places I visited. I printed some of it in *73* at the time, but most of it never got into print. Should I dig some out and see if it's still fun to read after twenty years?

Getting back to QSLs, with QSL bureaus, much of the postage curse is eased. If you work DX you have to have cards. If you're into any special modes it's pretty rotten not to QSL. This will be even more critical as my new DX award takes hold, with certificates for working countries on automated high-speed CW, RTTY, packet, SSTV, and so on.

One more thing—if you order QSLs from us please be very careful in writing your name, call, and address. If you scribble and we read anything wrong, will you really expect us to make a new batch for nothing? We try to check and recheck, but that won't help if you've made a mess on your order blank.

Now, let's see what you can come up with for a new *73* QSL design.

SOMETHING YOU CAN DO!

Many of you are frustrated about the dwindling number of newcomers to our hobby and have been asking what you can do personally to help the situation.

Our most serious loss has been in the number of youngsters entering the hobby—it's dropped from about 75% to under 15%. Indeed, this loss of youngsters accounts a good deal for the catastrophic drop in new hams we've experienced over the last twenty years.

If we want to get kids interested in hamming we have to reach them—through school radio clubs—and through ham magazines in school libraries. You and your local ham club can sponsor a school radio club and help it get started. Getting a ham magazine into the school library is something you can do personally—a way to help pay your dues to your hobby, so to speak.

While I admit to a slight bias in this, let's look at it practically—if you were going to try and get some kids interested in amateur radio, which ham magazine would you give them to read? Would it be *QST*, with its acres of activity reports? *CQ* with contest news? *HR* with articles on how to build a 10-band all-mode transceiver? Or *73*, which will be running a Novice/Technician license study course? Sure, I loaded the question, but I didn't exaggerate much and you know it.

If you'll sponsor a subscription to *73* for a local school library, I'll go part way with you—making it available at less than our cost—$15 per year in the U.S. That's a 40% discount from the regular $25 subscription price! Here's your chance to get an interesting ham magazine out where the kids will have a chance to read it. This could make it much easier to get school radio clubs going.

I'll do my bit in *73* with plenty of simple construction projects to get 'em started building—articles on every new aspect of our hobby—and a simple technical home-study course in electronics.

For the cost of a dinner you can be a local hero—and your gift just might help some youngster get into amateur radio—and then into electronics or communications as a career. You won't find a cheaper way to have a profound effect on young lives—or to help your hobby.

Amateur radio has provided you with a lot of fun over the years—isn't it time you started helping us attract youngsters in repayment? Please send me the name and address of the school you wish to endow with a subscription to *73* and I'll see they get it with a note that it is a gift from you. At $15 a year, we lose a little money on each subscription, so we're backing you the best we can. . .without going broke in the process—which would benefit no one. ■

SPECIAL EVENTS

XMASTIME AWARD
DEC 1–31

The Hen House Gang will be sending out the Christmastime Bethlehem and Santa Award during the month of December. Operation is on 10m, 20m, 40m, and Novice CW. For the Santa envelope and fold-up card, send a first-class stamp only; envelopes will be provided. For more information, write to the club president, Robert J. O'Neil W1FHP, Hard Hill Road, Bethlehem CT 06751.

FARIBAULT MN
DEC 6

The annual Handi-Ham Winter Hamfest will be held on December 6 at the Eagles Club in Faribault, Minnesota. Registration begins at 9 a.m. Talk-in on .19/.79. For more information, contact Don Franz W0FIT, 1114 Frank Avenue, Albert Lea MN 56007.

HAZEL PARK MI
DEC 7

The Hazel Park ARC will hold its 21st annual Swap and Shop on December 7 at the Hazel Park High School, 23400 Hughes. North of 9-Mile, west of Dequinder. General admission is $2 in advance, $3 at the door. Children under 11 free. Tables $1 per foot. Talk-in from the 9-Mile and I-75 area on 146.52. For tickets and table reservations, write to HPARC, PO Box 368, Hazel Park MI 48030.

LYNCHBURG 200TH
DEC 13

The Piedmont ARA will operate special-event station AA4UM on December 13 from 8 a.m. to 8 p.m. to celebrate the 200th birthday of the city of Lynchburg, Virginia. From 8 a.m. until noon the frequency will be 3.855, and from noon until 8 p.m. it will be 14.302. For a commemorative certificate, send QSL and an SASE to Piedmont ARA, PO Box 11362, Lynchburg VA 24506.

CLARK COUNTY EVENT
DEC 13–14

The Clark County ARC of Bethlehem, Indiana, will operate W9WWI/9 from 1700 to 0300 UTC on December 13 and from 1300 to 2000 UTC on December 14. Frequencies: 3.905, 7.240, 14.290, 21.365, and 146.25/.85. For a certificate, send a large SASE to CCARC, Box 532, Jeffersonville IN 47131.

CHRISTMAS TOY TEST
DEC 27

The Piano Amateur Radio Klub will operate special-event station WQ5S—"Christmas Toy Test"—from Plano in Collin County, Texas, beginning at 1600 UTC on December 27 and ending 24 hours later. The idea behind this event is to give "new Christmas toy" owners an opportunity to try out their rigs/accessories. Look for station operation on the following bands: the center of the Novice bands ±QRM; the lower 25 kHz of the General phone bands ±QRM; and 146.52, 52.525, and 29.600 MHz FM, along with 144.200 SSB. QSL via Brad Fuller WQ5S, Rte. 11, Box 24, McKinney TX 75069.

MICHIGAN 150TH
JAN 25

The Oakland County ARS will operate W8TNO on January 25, from 1600 to 0000 UTC, to celebrate the 150th anniversary of the state of Michigan. Operation will be on 20 to 80 meters SSB and CW. Suggested frequencies are 14.270, 7.270, 3.870; CW—7.130 and 3.730. For a special certificate, send a 9 x 12 SASE to W8TNO.

73 INTERNATIONAL

Number 25 on your Feedback card

NOTES FROM FN42

As the holidays approach, greetings fill the air: Merry Christmas! Happy New Year! Happy Chanukah! And to those of you who celebrate these events on December 25th, January 1, and December 27th, respectively, we of *73 Amateur Radio* wish you much merriment, happiness, and reasons to be thankful. Since this is "*73* International," we also extend best wishes for Chanukah to Israel, for Ethiopian Christmas (January 7), Boxing Day (December 26, Canada and Great Britain), Happy New Year's Holiday to Scotland (Jan. 2), Happy Year of the Rabbit to China (year 4624, Jan. 29), and Happy Independence Day to Bahrain (Dec. 16), Burma (Jan. 4), and Nauru (Jan. 31). Apologies to any whose nation has a major holiday not listed here; we could only do our best. When you work 4X or 4Z, ET, VE, G, B, A9, XZ, or C2 on or near the appropriate days, send your best wishes, too. Be the first non-Bahraini to send special greetings for December 16. . . you'll probably be given the keys to Manama—and maybe a temporary license to operate, and A92BW will have to take back his words, "There is absolutely *no chance* of visitors obtaining a license. . . . " Stranger things have happened as results of friendly, thoughtful geetings.

It isn't too late to wish a happy 80th anniversary of its sovereignty to Liechtenstein, either. . . see news about HB0 below.

FOR SALE—OR WANTED

The DOC has approved VK3's proposed advertising of amateur radio equipment for sale or wanted on the weekly WIA Sunday broadcasts. VK3 now joins VK5 and VK6, which have similar activity. It will be strictly controlled: no prices to be used, and all adverts must be screened competently. Des Clarke VK3DES,State Secretary, has taken on the task. Requests must go to him in the VK3 Division office by each Thursday; if approved they are aired Sunday, and any interested listener can contact him and receive the phone number of the person who placed the ad.

The Sunday broadcast is transmitted over several bands simultaneously and thus covers much of Australia, New Zealand, and some Pacific islands (propagation permitting).

TRAINS AND AMATEURS

I did not realize how popular amateur radio was with railway workers or enthusiasts until the feedback started after my column on "VK5 Amateurs Go Rail Mobile" [*73* International, March and April, 1986]. I received many letters from various countries and, from Heinze DJ3UN, even an international callbook of amateurs belonging to FIRAC (Federation Internationale des Radioamateurs–Cheminots). So: here is more on the subject, from Graham Horlin-Smith VK5AQZ, J150/Amateur Radio Celebration's coordinator.

WHISTLE STOPS WITH AMATEUR RADIO

VK5JSA's most recent activity has been to work from the Jubilee Industry Trade Train, which enjoyed a three-month successful run, presenting amateur radio and news of South Australia's Jubilee Year to community groups, amateurs throughout Australia, and the lucky DX stations that were able to catch it.

The travelling showplace consisted of nine diesel-hauled modern carriages including (1) a VIP entertainment car, (2) a power-equipped carriage to supply the total requirements of the train at 20 different whistle stops, plus a week at the beginning and in Adelaide at the end, and (3) a Communications Centre breakvan (15' x 9') at the end of Carriage Seven (home for the VK5JSA S.A. radio amateur volunteers for the three-month trip), with space for static displays of amateur radio materials, HF and 2-metre stations, two operators, and a stream of visitors.

The Wallaroo whistle-stop ops. From the left: Doug VK5NIY, John VK5BL, Andy VK5NTT, Wally VK5NWA, Norm VK5HL, and Lloyd VK5LL. "Wallaroo" is the aboriginal word for. . . well, discreetly ask the next Aussie you meet. (Photo by VK5NTT)

Russell VK5KAK, Geoff VK5PXK, and Ron VK5ARC, Noarlunga Centre amateurs. (Photo by Graham VK5AQZ)

Among a distinguished group of volunteers and workers were several whose solo efforts are worth a mention. Jack VK5FV was our Man Friday who slipped out of Adelaide to activate the station at Lameroo (with Les VK5LH) and at Burra. Terry VK5ATN looked after Balaklava and Riverton. The displays were professionally accomplished by Peter Koen (the display engineer of the Trans Australian, "Live Across The Nullarbor"). And at each whistle stop a team of fresh, local amateurs took over VK5JSA/Portable, which resembled a sort of radio marathon across VK5-land (which is 1-1/2 Texas' size).

Activating VK5JSA at each stop meant installing a pre-set five-band trapped vertical, which was clamped to an external passenger handrail and swung outwards, allowing about a two-foot clearance from the train. The use of the 2-metre rig depended on the proximity of the nearest repeater.

•Over 5,000 contacts were logged, with a high percentage of Jubilee 150 QSLs confirming the Trade Train contact.

•Propagation limitations made contacts on 20, 15, and 10 metres difficult—as did some operating locations.

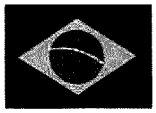
•VK5JSA was well received nightly on 80 metres by Australian stations calling in, and the J150 nets were further boosted whenever the Trade Train appeared on the net frequency.

•The three-month program for VK5JSA enabled stations to catch the train and collect points for the Jubilee 150 Award, with VK5JSA and VK5 contacts. As of July 1st, the Jubilee callsign changed to V15JSA, and DX stations were invited to qualify for the award as follows: one contact with V15JSA *or* five with V15s for the Bronze Award, one with V15JSA *plus* five with V15s for the Silver Award, and, for the Gold Award, by meeting the qualifications published (or to be published) in American amateur radio magazines.

NOTE: Australian and DX recipients of J150 Awards have been made "Honorary VK5s" to assist other DX stations to qualify for the award. (Certificated stations are worth 15, 30, or 50 points, plus band points, for triple-certificate holders, towards the 150 points needed for the very popular South Australian Award.)

There now is a rumor that we might even put V15JSA on board a Formula 1 racing car in this month's [October] "Grand Prix," from the Adelaide circuit!

AUSSIE YLs



Without doubt, two ladies stand out as amateur radio pioneers, particularly within VK.

The first was Mrs. Florence McKenzie VK2FV, first licensed as 2GA in 1921. "Mrs. Mac" was known to countless thousands of American and other Allied servicemen during WWII due to the Morse code lessons she gave in Sydney (VK2) during that trying period. A Silent Key since 1982, her memory is perpetuated by The Florence McKenzie Award instigated by the ladies of ALARA (Australian Ladies' Amateur Radio Association).

The second OOT/YL is Austine VK3YL, the first YL into the Royal Australian Airforce Reserves and the only Australian YL to achieve the DXCC honor roll. She also is remembered for performing a similar service as CW instructor, but in Melbourne (VK3). She is the oldest registered member of the WIA, with more than 54 years of continuous membership.

Of latter days, two ladies come to mind as outstanding contributors to our hobby, Heather VK2HD and Jenny VK5ANW. VK2HD is a regular net controller on 14.220 at 0600 UTC, and was recently appointed as a director of the YASME Foundation managing board. Jenny is the State Representative of, and Australian Secretary of, ALARA, and also is State Secretary of the WIA.

In a future column I will tell you more about ALARA, which is worldwide with a membership of around 200. Meanwhile, if you are interested in joining, write the ALARA Treasurer, PO Box 4, Middle Brighton, Australia 3186; listen in to members of YL clubs around the world meeting on the sixth of each month, on the hour (with 0400 UTC and on being most popular): *Phone:* 3.588, 14.288, 21.188, 21.388, 28.588, 28.688 *CW:* 3.530, 14.058, 21.058, 21.133, 28.058, 28.133.

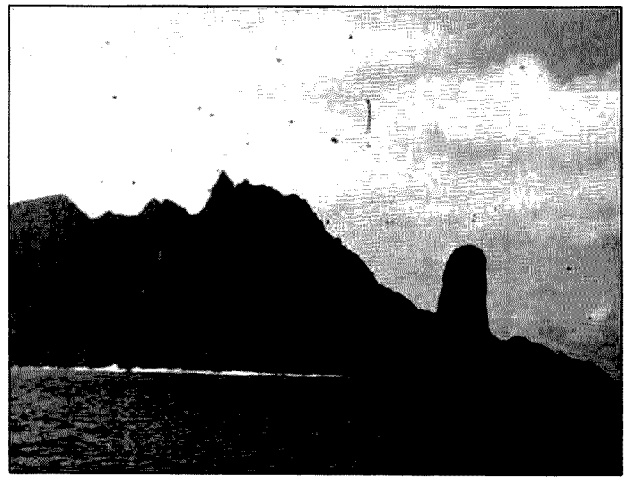
TRINDADE ISLAND

Trindade Island, Fernando de Noronha, and St. Peter & St. Paul Rocks are three rare spots that belong to Brazil, but due to their distances from the coast they count as separate countries for the DXCC award. So every DXpedition to those islands is an eagerly anticipated event. Each time, many friends are able to work a new one or sometimes a new country on a particular band or mode. It was the same during the last DXpedition to Trindade Island.

The Brazilian navy supplies the island every two months and usually authorizes the trip of one or two amateurs. This time, Claudio PY1DFF and Ric PY1VOY were ready to go after making a few arrangements. First they got a four-band vertical antenna, model DXV-4, from Electril, two more verticals for 20 and 15 metres, and a longwire for 80 and 160.



After five days, the ship finally arrived off Trindade Island. Immediately, the ship commander ordered the helicopter to land the people and equipment. The DX team decided to stay in the Meteorological Station, and within 15 minutes the DXV-4 was up and ready.

After the very first QSO, the pileup was tremendous, and the operators took turns operating during the entire day in spite of poor propagation on the high bands. At night the conditions were excellent for Europe, Asia, and North America on the 7-MHz band. During the split-time operation on 7.001, the pileup was very strong between 7.003 and 7.010. At 0700 UTC in the ZL2AAG net, it is possible to work many Pacific-area stations.

After 16 hours, 1,285 stations were worked, most of them on 40. (QSL information: PO Box 90415, 25600 Petropolis, RJ, Brazil.)

The DXpedition team: Claudio (left) and Ric.

Trindade Island.

Dulce PY1BUL receives GPCW winner's trophy from GPCW manager, PY1JN.

PY1DFF/PY0T and PY1VOY/PY0 are grateful to the Brazilian Navy and the commander of the *Gracia Aranha* for making their DXpedition possible.

de PY1APS/PY7APS

WORLD'S 1ST EHSC YL

Several CW high-speed clubs exist, like the famous FOC (Finest Operators Club), like TOPS, and like the HSC series: High Speed Club, Very High Speed Club (VHSC), Super High Speed Club (SHSC), and Extremely High Speed Club (EHSC). Membership in each requires a 30-minute operating period (normal conversation) receiving and sending at 25 to 30 wpm for the first category, 40 wpm for the second, 50 wpm for the third, and 60 wpm for the EHSC level. No computers, decodifiers, or keyboards are allowed during any operating. Five HSC members must QSL the candidate for HSC membership, four VHSC QSLs are needed for that level, three for SHSC candidates, and two sponsors are required for EHSC.

Brazilian YL Dulce PY1BUL became the 1,370th member of HSC, the 213th of VHSC—and the 3rd YL in the world—the 88th of SHSC (and the second YL), and member #46 and the *first* YL member of EHSC. Hers is also the first Brazilian station to earn that honor! If you would like to chat with Dulce, you may do so in English, French, German, Italian, Portuguese, or Spanish!

We are proud of our PY1BUL! And according to her, pretty soon we will have another Brazilian EHSC member—Alex PR7PO. (He and Harold PY1ZAE are the only active Brazilian members of the FOC at this time.)

GREAT BRITAIN

Jeff Maynard G4EJA
32 Waldorf Heights
Hawley Hill
Camberley GU17 9JQ
England

The involvement that the RSGB (Radio Society of Great Britain) has in the affairs of amateur radio in the UK never ceases to amaze me. Not that I would like any *73* subscribers to read anything derogatory into that remark. The RSGB does a very good job and represents UK amateurs very, very well. Witness just two recent RSGB successes—the opening of 50 MHz and the opening of Morse on the air to Class B (VHF only) operation.

No, what amazes me is the extent to which RSGB is involved with all aspects of amateur radio—technical, regulatory, operating, awards, representation on official bodies, and many more. Among RSGB's specific activities: rally organization, special-event callsign allocation, publication of *Rad Com*, slow Morse transmissions, beacons and repeaters, GB2RS news broadcasts, film and tape library, QSL Bureau, reciprocal licensing, equipment insurance, intruder watch, and propagation studies.

All of this is in addition to the general promotion of amateur radio as envisioned by the society's objectives (my paraphrasing):

•To promote the general advancement of the science and practice of radio communications.
•To facilitate the exchange of ideas and information on the subjects amongst members and others.
•To obtain the maximum freedom of action for amateurs consistent with safeguarding the interests of all concerned.

The affairs of the society are organized and directed by its Council, chaired by the president and including the immediate past president, the executive vice-president (who becomes president in the following year), the "Honorary Treasurer" (responsible for the all-important funds), and up to 15 members elected annually by postal balloting amongst all voting members of the society.

A society like the RSGB exists both to serve and be served by its members. This necessitates a continuing *two-way* flow of information, ideas, and opinions. Some 20 Regional Representatives interface between the Council and more than 100 Area Representatives. Their areas of responsibility may be as large geographically as northern Scotland or as large numerically as Greater London. The area representatives look after smaller geographic areas containing up to 20 or so different local radio clubs; they are the ones who best know and understand views at the grass-roots level, often being current or past officers of a local club.

A significant element of the work of the society is entrusted to its 16 standing committees and its management group. These are on: Education, Electromagnetic Compatibility, Finance and Staff, Exhibition and Rally, HF, HF Contests, IARU, Licensing Advisory, Membership and Representation, Microwave, Propagation Studies, Raynet, Repeater Management, Technical and Publications, VHF, and VHF Contests. Attached to the committees are a number of Honorary Officers charged with coordinating or managing particular aspects of the society's work.

All of these posts are voluntary, of course, as are the society's representatives on seven British Standards Institute committees and five CCIR study groups. It is the continuing desire of so many to offer their time and energy to help the society achieve its objectives that is in no small part responsible for the excellent state of and high regard for amateur radio in the UK.

GARDEN CITY CONTEST

The Bangalore Amateur Radio Club (BARC) and the Vivesvaraya Industrial & Technical Museum (Bangalore) announce the 1986 Garden City Contest on CW (between 1200 UTC Saturday, December 13 and 1200 UTC Sunday, December 14) and phone (1200 UTC Saturday, December 20 and 1200 UTC Sunday, December 21).

•There is no entry fee. Open to all licensed amateurs worldwide; single operator only, power and frequency restrictions as per stipulations in the contestant's license.
•80, 40, 20, 15, 10 meters; contact may be made with the same station once in each band.
•Exchange: Complete RST report and contact number in three or more digits—e.g., if VU2ABC is your first contact, your report would be 599001; if VU2XYZ is your 20th contact, your report would be 559020.
•Entry classes: A for VU2s with Grade 1 license; B for VU2s with Grade 2 license; no designation for all non-VU2 hams.
•Points: For VU2s, complete contacts, Asia, including India, 1 point; Europe, Africa, Australia, 2; North and South America, 3. For DX stations, Asian, 1 point for every VU2 contact; 2 points for European, African, and Australian stations; 3 points for stations in North and South America.

Entries must be postmarked January 15, 1987 or before, and addressed to The Convenor, Garden City Contest 1986, Bangalore Amateur Radio Club, PO Box 5053, Bangalore 560001, India.

Winning certificates will be awarded the three top scorers in each class; all contestants submitting logs will receive certificates of participation, also (n−1)th place winner will be awarded in each group (where n is the total number of entries received).

Rulings of the contest committee (nominated members of BARC and VITM) will be binding and final; contest not open to employees of the National Council of Science Museums or BARC members who receive, scrutinize, and evaluate entries, and recommend the awards.

For further information, write VU2RAH/W7 at above Arizona address or phone him at (602)-921-0145.

LIECHTENSTEIN

Guenther Erich Holzknecht
HB0CZS, Secretary
Liechtenstein Amateur Radio Association
PO Box 103, FL-9493 Mauren
Principality of Liechtenstein

The Liechtenstein Amateur Radio Association (LARA) has been formed for the hams and SWLs of the Principality, and IARU membership has been applied for. Until now, Swiss operators have determined amateur activity in the country and could change their HB9 calls into HB0 calls when visiting. One result was that as many as 200 HB0 stations were on the air during a single weekend. From now on, all non-Liechtensteiners must put HB0 in front of their own callsigns.

There are 11 resident operators in Liechtenstein, five with shortwave licenses, and they are active on all bands. There is a club station (HB0FL—the FL standing for Furstentum Liechtenstein), a repeater has been set up, and LARA has established the 1.Liechtenstein Award. "We like OSLing and enjoy DXing as well as rag-chewing. For us it's always a pleasure to talk to Americans and we hope to meet as many operators [from there] as possible."

Thanks to George Baustert AA4VB, VP, Florida Westcoast DX Ring, for this information.

NEW ZEALAND

D. J. (Des) Chapman ZL2VR
459 Kennedy Road
Napier
New Zealand

I have been absent from these pages since June holidaying in the U.S. and Canada. We are very lucky people, belonging to such an international fraternity as amateur radio. Everywhere I went I was immediately among friends. The hospitality was overwhelming.

I have many happy and memorable times to look back on, from the Irish KA6 I worked pedestrian mobile in Victoria, B.C., who was sure he knew me (he reads this column—at least I have one reader!), the Hamfest group at Jackson's Mill, West Virginia, the Prince Edward Island gang and the breakfast meeting, the Amsterdam [New York] stopover with a ham family (Mum, Dad, and all three daughters are hams) and the visit they took me on to the Antique Wireless Association Museum where I met the curator, Bruce W2ICE, and all the others I met for an "eyeball" or on-air QSO. I even visited the Doghouse Restaurant in Seattle, where a back room is reserved for ham operators to have their lunch away

from the main eating room, and met some of the local amateurs.

I was especially fortunate to meet with Wayne W2NSD (and his two beautiful greyhounds), managing editor Chris KA1MPL, and many of the *73* staff when I stopped over in Hancock, which is a delightful New Hampshire town. What a marvelous environment to have as a work place! It must be a pleasure to go to work each day! [*We enjoyed having you visit us! Come again! —International Editor*]

Another experience to be remembered was the chance to assist at the EXPO Amateur Station and Display in Canada Place, in Vancouver. Unfortunately, only my host, Jack VE7CMD, and I were there for the Friday evening 5–10 p.m. period, and we were so busy answering visitors' questions that there was little time to operate VE7EXPO, but at least I did log a couple of contacts on two meters. The VE7EXPO QSL card is a wonderful memento of this occasion.

While in Vancouver I had the use of VE7CMD's equipment and logged many fine QSOs, finished off my Worked All States portable VE7, and now await QSLs only from North Dakota, Rhode Island, and Wyoming to place my application for the award.

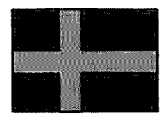
I must also mention the assistance I received from some of the great nets operating in North America: the YL Net, the Century Club Net, and the Rocky Mountain (Hi Noon) Net, just to name three. All net controllers made me very welcome, helped me when they could, and made my days on the air much more enjoyable and memorable.

NZART'S 60TH

Much went on while I was away and it was still going on when I returned. August 16th was the 60th anniversary of The New Zealand Association of Radio Transmitters; the still-active Tom Clarkson was honored as a founder member and received a plaque from NZART President Terry Carrel ZL3QL; a special callsign has been allocated to NZART's HQ station, ZL6A, which will be operating on all bands (conditions permitting)—and there will be a special QSL card; and a Harkness Fellowship has been awarded to Dr. Murray Milner ZL2LB to study for up to two years in the U.S. and bring back knowledge and experience to help in the planning of New Zealand satellite communications.

Radio masts and antennae and town planning were also to the fore during my holiday absence and another favourable decision made. . . I attended a forum on this subject while in the States so it is apparent that the problem is worldwide; we must be constantly vigilant when town planning and amateur radio matters are being discussed to see that our rights are defended.

In my next column I will cover our new Radio Regulations, which became effective in July after two years of consideration by ZL amateurs, with whom our regulatory body, the New Zealand Post Office, kept in touch.



POLAND

Jerzy Szymczak
78–200 Bialogard
Buczka 2/3
Poland

Jurek Prajsner SP5NZ/MM travelled with the Polish passenger vessel *Stefan Batory* on a Caribbean voyage from February 13 to March 20. He used FT-790R and FT-290 Yaesu transceivers with 30-W amplifiers, and attached yagis to a bulwark rail, 12 element for the 70-cm band and 5 element for 2 metres, with a 7-metre antenna feeder cable. It was difficult to establish contact with Caribbean region hams for converters there work on 146–147 MHz, and most hams there speak only Spanish. SP5NZP/MM signals made a hit off the coast of Great Britain and BRD through 70-cm converters, too. He made 40 QSLs through OSCAR 10 when outside the range of local stations. His most interesting communications were with "KA1MLN—operator Ester from Boston, W1QXX—operator Jack, LU8EBH—operator Col, and CT3BI—operator Jose."

The ham student club SP9PDF from Gliwice went to the Aland Islands in 1984 [*see Sweden column for more Aland activity*]. SP6LHI, SP6BGB, and SP9FIH operated at 20° longitude and 60° latitude with FT-101Z and antenna W3DZZ. On July 24th at 2100 UTC they began to call on 14.195 MHz and other bands using antennas 14 AVQ, TH3MK3, and 402 BA. On weekends they repeatedly exceeded 130 QSOs per hour; 7,100 contacts with stations in 116 countries were made in 10 days, including 720 QSOs with Poland. Solar activity held contacts with the U.S. to 75; 250 with Japan. They made a hit with contacts on 80 with ZP5JAL and AP2SA. They much appreciated the hospitality they received from Finnish hams.

Polish DX Contest winners (countries confirmed/accepted countries), CW: SP6RT 314/334; Phone: SP9VU 312/324; Mixed: SP7HT 316/339. There are some rule changes for the SPDX Contest for April, 1987 (SSB; the contest is CW in even-numbered years), which will be published here next time.

SWEDEN

Rune Wande SMØCOP
Frejavagen 10
S–155 00 Nykvarn
Sweden

Enthusiastic and active YLs in Finland and Sweden arranged a DH/SM YL meeting on "neutral soil" last May. Raija SMØHNV/OH1RL, who has been to YL meetings around the world, decided it would be great to have an annual Scandinavian YL get-together, and with the Finnish YL group, organized the first one on the island of Aland—OHØ-land. [Aland is a group of islands in the Gulf of Bothnia—an autonomous department, 25 miles from Sweden and 15 from the Finnish mainland.]

Lars OHØRJ kindly lent his FT-757GX and a multiband dipole, and arranged for the club call—OHØAB (Anna Bella) to be used. Several hundred QSOs were made despite the beautiful weather; such a prefix used by YL operators stirred up quite a pileup, which was handled efficiently.

Other events included a transformer-throwing contest won by Eeva OH3ST. A small group of accompanying OMs were allowed to participate, and "the OH hams won thanks to superior transformer-handling technique and the famous Finnish SISU (stamina)." [Opinions expressed by correspondents for *73* International are not necessarily those of the magazine, which does not want to start a war—and the International Editor once knew a Swede from Karlskrona who. . . but that's another story.] Next year the meeting is planned for some place in Sweden.

NEW SWEDISH CALLBOOK

Up to the late 70s the Swedish licensing authority, Televerket, annually published a callbook including all amateurs in Sweden and sent it free of charge to all license holders. Then suddenly it ceased to come and no explanation was given, but we were promised a new book, every year. After five years and no callbook, Tage SM6GDL started to publish *Tage's List*, a callbook he must have spent a fortune on phone calls to keep up to date—a tremendous job; it seems that hams are changing QTHs more often than average people. He included repeater maps, the DXCC list, antenna-construction articles, and other valuable things in his book—which recently was renamed *The Amateur Radio Guide*.

Much to everybody's surprise this summer, every licensed ham in Sweden received, free, a new SM callbook from Televerket, including a name and QTH index which is very useful. It now will be published annually and can be subscribed to for 40 Swedish kroner (about US $6) or about half the price of Tage's book. Single copies are 60 Sw. kroner. It is called *Amatorradioforteckning E:22* and may be ordered from Televerket Radio, RFT, S-123 86 Farsta, Sweden.

SWITZERLAND

Heinz Mueller HB9BOS
PO Box 119
CH-4144 Arlesheim
Switzerland

DIG Schweiz (Diploma Interests Group, Switzerland) was formed last September by HB9BNQ, HB9DDZ, and HB9BOS, as a section of DIG Germany. The club station is HB9DIG (and counts three points toward the DIG Member Award). The group was formed on the basis of an opinion survey which resulted in an expression of favor by 50% of those participating. Purposes of the group include fostering greater activity, better discipline on the air, and courtesy on all amateur wireless bands.■

DEALER DIRECTORY

Fontana CA

Complete lines—ICOM, Mirage, KLM, Larsen, Astron, B & W. Over 4000 electronic products for the hobbyist. Also CB and business radios. Serving you from a 6000 sq. ft. store. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA

Bay Area's newest amateur radio store. New & used amateur radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1775A S. Winchester Blvd., Campbell CA 95008, 370-6665.**

Miami FL

Casa Marconi, Inc. Pre-owned communications equipment. We do repairs. Send SASE for prices. **Casa Marconi, Inc., 7189 SW 8th Street, Miami FL 33144, 264-8443**

Littleton MA

The reliable ham store serving NE. Full line of ICOM & Kenwood, Drake, Daiwa, B&W accessories. Curtis & Trac keyers. Larsen, Hustler, Telex/Hy-Gain products. Mirage amps., Astron P.S., Alpha Delta protectors. ARRL & Kantronics instruction aids. Whistler radar detectors. Full line of coax fittings. **TEL-COM Electronic Communications, 675 Great Rd. (Rt. 119), Littleton MA 01460, 486-3400/3040.**

Preston ID

Ross WB7BYZ has the largest stock of amateur gear in the Intermountain West and the best prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

New Castle DE

Factory authorized dealer! Yaesu, ICOM, Ten-Tec, KDK, Kenwood, AEA, Kantronics, Santec. Full line of accessories. No sales tax in Delaware. One mile off I-95. **Delaware Amateur Supply, 71 Meadow Road, New Castle DE 19720, 328-7728.**

Derry NH

Serving the ham community with new and used equipment. We stock and service most major lines: AEA, Astron, B&W, Cushcraft, Encomm, Hy-Gain, Hustler, ICOM, Kenwood, KLM, Larsen, Mirage, Mosley; books, rotors, cable and connectors. Business hours Mon.–Sat. 10–5, Thursday 10–9. Closed Sun./Holidays. **Rivendell Electronics, 8 Londonderry Road, Derry, NH 03038, 434-5371.**

DEALERS

Your company name and message can contain up to 25 words for as little as $150 yearly (prepaid), or $15 per month (prepaid quarterly). No mention of mail-order business or area code permitted. Directory text and payment must reach us 60 days in advance of publication. For example, advertising for the March '87 issue must be in our hands by January 1st. Mail to *73 Amateur Radio*, WGE Center, Peterborough, NH 03458. ATTN: Hope Currier.

December is the solar cycle minimum, and HF propagation will be poor on the higher frequencies, with early band closings on and above 14 MHz. Unsettled to active magnetic field conditions will cause fair daytime conditions where noted. Magnetic storm levels may be reached on the 4th through the 6th, resulting in very bad propagation on east-west paths. North-south paths could be interesting. Look for unusual ionospheric propagation on 6 meters and above during the first week.
